Heuristic processing means that calibre will scan your book for common patterns and fix them. As the name implies, this involves guesswork, which means that it could end up worsening the result of a conversion, if calibre guesses wrong. Therefore, it is disabled by default. Often, if a conversion does not turn out as you expect, turning on heuristics can improve matters. Read more about the various heuristic processing options in the [User Manual](#).

☒ Enable heuristic processing**Heuristic Processing**☒ Unwrap linesLine un-wrap factor : 0,40☒ Detect and markup unformatted chapter headings and sub headings☒ Renumber sequences of <h1> or <h2> tags to prevent splitting☒ Delete blank lines between paragraphs☒ Ensure scene breaks are consistently formattedReplace soft scene breaks:☒ Remove unnecessary hyphens☒ Italicize common words and patterns☒ Replace entity indents with CSS indents

Search and replace uses *regular expressions*. See the [regular expressions tutorial](#) to get started with regular expressions. Also clicking the wizard button below will allow you to test your regular expression against the current input document. When you are happy with an expression, click the Add button to add it to the list of expressions.

Debug

Choose a folder to put the debug output into. If you specify a folder, calibre will place a lot of debug output into it. This will be useful in understanding the conversion process and figuring out the correct values for conversion parameters like Table of Contents and Chapter Detection.

The debug process outputs the intermediate HTML generated at various stages of the conversion process. This HTML can sometimes serve as a good starting point for hand editing a conversion.

Debug the conversion process.
