# **i.MX 6SoloLite Applications Processor Reference Manual**

Document Number: IMX6SLRM  
Rev. 1, 04/2013

## Contents

Section number	Title	Page
----------------	-------	------

### Chapter 1 Introduction

1.1	About This Document.....	125
1.1.1	Audience.....	125
1.1.2	Organization.....	125
1.1.3	Suggested Reading.....	126
1.1.3.1	General Information.....	126
1.1.3.2	Related Documentation.....	126
1.1.4	Conventions.....	126
1.1.5	Register Access.....	128
1.1.5.1	Register Diagram Field Access Type Legend.....	128
1.1.5.2	Register Macro Usage.....	128
1.1.6	Signal Conventions.....	129
1.1.7	Acronyms and Abbreviations.....	130
1.2	Introduction.....	131
1.3	Target Applications.....	132
1.4	Features.....	132
1.5	Architectural Overview.....	135
1.5.1	Simplified Block Diagram.....	135
1.5.2	Architectural Partitioning.....	136
1.5.3	Endianness Support.....	138
1.5.4	Memory Interfaces.....	138

### Chapter 2 Memory Maps

2.1	Memory system overview.....	139
2.2	ARM platform memory map.....	139
2.3	DMA memory map.....	145

Section number	Title	Page
<b>Chapter 3</b>		
<b>Interrupts and DMA Events</b>		
3.1	Overview.....	147
3.1.1	AP interrupts.....	147
3.2	SDMA event mapping.....	151
<b>Chapter 4</b>		
<b>External Signals and Pin Multiplexing</b>		
4.1	Overview.....	153
4.1.1	Pin Assignments.....	153
4.1.2	Muxing Options.....	208
<b>Chapter 5</b>		
<b>Fusemap</b>		
5.1	Boot Fusemap.....	255
5.2	Lock Fusemap.....	262
5.3	Fusemap Descriptions Table.....	263
<b>Chapter 6</b>		
<b>External Memory Controllers</b>		
6.1	Overview.....	271
6.2	Multi-mode DDR controller (MMDC) overview and feature summary.....	271
6.3	EIM-PSRAM/NOR Flash controller overview.....	272
6.3.1	EIM features.....	273
6.3.2	EIM boot scenarios.....	274
6.3.3	EIM boot configuration.....	274
6.3.4	OneNAND requirements.....	274
<b>Chapter 7</b>		
<b>System Debug</b>		
7.1	Overview.....	275
7.2	Chip and Cortex-A9 Core Platform Debug Architecture.....	275
7.2.1	Debug Features.....	276

Section number	Title	Page
7.2.2	Debug System components.....	277
7.2.2.1	AMBA trace bus (ATB).....	278
7.2.2.2	ATB replicator.....	278
7.2.2.3	Embedded Cross Triggering.....	278
7.2.2.3.1	Cross-Trigger Matrix (CTM).....	279
7.2.2.3.2	Cross-Trigger Interface (CTI).....	280
7.2.2.4	Debug Access Port (DAP).....	280
7.2.2.5	CoreSight trace port interface (TPIU).....	281
7.2.3	i.MX6SoloLite-Specific SJC Features.....	282
7.2.3.1	JTAG Disable Mode.....	282
7.2.3.2	JTAG ID.....	282
7.2.4	System JTAG Controller - SJC.....	283
7.2.5	System JTAG controller main features.....	283
7.2.6	SCJ TAP Port.....	283
7.2.7	SJC main blocks.....	283
7.3	Smart DMA (SDMA) core.....	284
7.3.1	SDMA On Chip Emulation Module (OnCE) Feature Summary.....	284
7.3.1.1	Other SDMA Debug Functionality.....	285
7.3.1.2	SDMA ROM Patching.....	286
7.4	Miscellaneous.....	286
7.4.1	Clock/Reset/Power.....	286
7.5	Supported tools.....	286

## Chapter 8 System Boot

8.1	Overview.....	289
8.2	Boot modes.....	290
8.2.1	Boot mode pin settings.....	290
8.2.2	High level boot sequence.....	291
8.2.3	Boot From Fuses Mode (BOOT_MODE[1:0] = 00b).....	292

Section number	Title	Page
8.2.4	Serial Downloader.....	293
8.2.5	Internal Boot Mode (BOOT_MODE[1:0] = 0b10).....	294
8.2.6	Boot security settings.....	295
8.3	Device Configuration.....	296
8.3.1	Boot eFUSE Descriptions.....	296
8.3.2	GPIO Boot Overrides.....	298
8.3.3	Device Configuration Data.....	300
8.4	Device Initialization.....	300
8.4.1	Internal ROM /RAM memory map.....	300
8.4.2	Boot Block Activation .....	301
8.4.3	Clocks at Boot Time.....	302
8.4.4	Enabling MMU and Caches.....	303
8.4.5	Exception Handling.....	304
8.4.6	Interrupt Handling During Boot.....	305
8.4.7	Persistent Bits.....	305
8.5	Boot Devices (Internal Boot).....	305
8.5.1	NOR Flash/OneNAND using EIM Interface.....	306
8.5.1.1	NOR Flash Boot Operation.....	306
8.5.1.2	OneNAND Flash Boot Operation.....	307
8.5.1.3	IOMUX Configuration for EIM Devices.....	308
8.5.2	Expansion Device.....	309
8.5.2.1	Expansion Device eFUSE Configuration.....	309
8.5.2.2	MMC and eMMC Boot.....	312
8.5.2.3	SD, eSD and SDXC.....	320
8.5.2.4	IOMUX Configuration for SD/MMC.....	320
8.5.2.5	Redundant Boot Support for Expansion Device.....	321
8.5.3	Serial ROM through SPI and I2C.....	322
8.5.3.1	Serial ROM eFUSE Configuration.....	323

Section number	Title	Page
8.5.3.2	I2C Boot.....	324
8.5.3.2.1	I2C IOMUX Pin Configuration.....	325
8.5.3.3	ECSPI Boot.....	325
8.5.3.3.1	ECSPI IOMUX Pin Configuration.....	327
8.6	Program image.....	328
8.6.1	Image Vector Table and Boot Data.....	328
8.6.1.1	Image Vector Table Structure.....	329
8.6.1.2	Boot Data Structure.....	330
8.6.2	Device Configuration Data (DCD).....	330
8.6.2.1	Write Data Command.....	331
8.6.2.2	Check Data Command.....	333
8.6.2.3	NOP Command.....	334
8.6.2.4	Unlock Command.....	335
8.7	Plugin Image.....	335
8.8	Serial Downloader.....	336
8.8.1	USB.....	337
8.8.1.1	USB Configuration Details.....	338
8.8.1.2	IOMUX Configuration for USB.....	338
8.8.2	Serial Download protocol.....	339
8.8.2.1	SDP Command.....	339
8.8.2.1.1	READ REGISTER.....	339
8.8.2.1.2	WRITE REGISTER.....	340
8.8.2.1.3	WRITE_FILE.....	341
8.8.2.1.4	ERROR_STATUS.....	342
8.8.2.1.5	DCD WRITE.....	343
8.8.2.1.6	JUMP ADDRESS.....	344
8.9	Recovery Devices.....	344
8.10	USB Low Power Boot.....	345
8.11	SD/MMC Manufacture Mode.....	346

Section number	Title	Page
8.12	High Assurance Boot (HAB).....	347
8.12.1	ROM Vector Table Addresses.....	348

## Chapter 9 Multimedia

9.1	Display and graphics subsystem.....	351
9.1.1	Electrophoretic Display Controller.....	352
9.1.2	SiPix Display Controller.....	353
9.1.3	PiXeL Pipeline.....	353
9.1.4	LCD Interface.....	353
9.1.5	CMOS Sensor Interface.....	354
9.1.6	2D Graphics Processing Unit (GPU2Dv2).....	354
9.1.6.1	2D feature summary.....	355
9.1.6.2	2D Performance.....	356
9.1.6.3	2D Software.....	356
9.1.7	Vector Graphics Processing Unit (GPUVGv2).....	356
9.1.7.1	Vector Graphics Features.....	356
9.1.7.2	Vector Graphics Performance.....	357
9.1.7.3	Vector Graphics Software.....	357
9.2	Audio subsystem.....	357
9.2.1	Audio subsystem module overview.....	357
9.2.2	Synchronous Serial Interface (SSI).....	359
9.2.3	Digital Audio MUX (AUDMUX).....	359
9.2.4	Sony/Philips Digital Interface (SPDIF).....	361

## Chapter 10 Clock and Power Management

10.1	Introduction.....	363
10.2	Device Power Management Architecture Components.....	363
10.2.1	Centralized components of clock generation and management.....	364
10.2.2	Centralized components of power generation, distribution and management.....	365

Section number	Title	Page
10.2.3	Reset generation and distribution system.....	365
10.2.4	Power and clock management framework.....	365
10.3	Clock Management.....	366
10.3.1	Centralized components of clock management system.....	366
10.3.2	Clock generation.....	369
10.3.2.1	Crystal Oscillator (XTALOSC) .....	369
10.3.2.2	LVDS I/O ports.....	369
10.3.2.3	PLLs.....	369
10.3.2.3.1	General PLL Control and Status Functions.....	371
10.3.2.4	CCM .....	372
10.3.2.5	Low Power Clock Gating unit (LPCG).....	373
10.3.3	Peripheral components of clock management system.....	373
10.3.3.1	Interface and functional clock.....	374
10.3.3.2	Block level clock management.....	374
10.3.3.2.1	Master clock protocol.....	375
10.3.3.2.2	Slave clock protocol.....	375
10.3.3.3	Clock Domain(s).....	376
10.3.3.4	Domain level clock management.....	376
10.3.3.5	Domain dependencies.....	376
10.4	Power management.....	376
10.4.1	Centralized Components of Power Management System.....	377
10.4.1.1	Integrated PMU.....	377
10.4.1.1.1	Digital LDO Regulators.....	378
10.4.1.1.2	Analog LDO regulators.....	379
10.4.1.1.3	USB LDO.....	380
10.4.1.1.4	SNVS regulator.....	380
10.4.1.1.5	Reverse well biasing.....	380
10.4.1.2	GPC - General Power Controller.....	380
10.4.1.3	SRC - System reset Controller.....	381

Section number	Title	Page
10.4.1.4	Power domain(s).....	382
10.4.1.4.1	Power distribution .....	382
10.4.1.4.2	Domain Memory and domain logic state retention in case of Power Gating...383	
10.4.1.4.3	Power Gating Domain Management.....	384
10.4.1.4.3.1	Cortex-A9 Core Platform.....	384
10.4.1.4.3.2	GPU2D.....	385
10.4.1.4.3.3	SoC.....	386
10.4.1.4.4	Power Gating domain dependencies.....	386
10.4.1.5	Voltage domains.....	387
10.4.1.6	Voltage domain management.....	387
10.4.1.6.1	Dynamic.....	387
10.4.1.6.1.1	DVFS.....	387
10.4.1.6.1.2	Voltage Scaling.....	388
10.4.1.6.2	Static .....	389
10.4.1.6.2.1	Standby Leakage reduction (SLR).....	389
10.4.1.6.3	Voltage domain dependencies.....	389
10.4.1.6.4	IO voltage .....	390
10.4.1.7	system domains layout.....	390
10.4.2	Power management techniques.....	392
10.4.2.1	Power saving techniques.....	393
10.4.2.2	Thermal-aware power management.....	393
10.4.2.3	Peripheral Power management.....	394
10.4.2.3.1	Main memory power management.....	394
10.4.2.3.2	Video-Graphics system power management.....	395
10.4.2.3.3	IO power reduction.....	395
10.4.3	Examples of External Power Supply Interfacing in the i.MX 6SoloLite based systems .....	395
10.5	ONOFF (Button).....	399

## Chapter 11

### System Security

11.1	Overview.....	401
11.2	Central Security Unit (CSU).....	403
11.2.1	CSU Overview.....	403
11.2.2	CSU Features.....	403
11.2.3	CSU Functional Description.....	404
11.2.3.1	CSU Peripheral Access Policy.....	404
11.3	Secure Non-Volatile Storage (SNVS).....	405
11.3.1	SNVS Overview.....	405
11.3.2	Tamper Detection.....	406
11.4	Data Co-Processor (DCP).....	406
11.5	High Assurance Boot (HAB).....	406
11.6	System JTAG Controller (SJC).....	407

## Chapter 12

### ARM Cortex A9 MPCore Platform (ARM)

12.1	Overview.....	409
12.2	External Signals.....	409
12.3	Platform configuration.....	411
12.3.1	Platform and SCU configuration.....	411
12.3.2	Core configuration.....	411
12.3.3	PL310 L2 Cache configuration.....	412
12.3.4	Endian Modes.....	412
12.3.5	Memory Parity error support .....	413
12.4	Performance and Power.....	413
12.4.1	Low-Power design.....	413
12.4.1.1	SRPG (State Retention Power Gating).....	413
12.4.1.2	Dynamic Voltage and Frequency Scaling (DVFS).....	414

Section number	Title	Page
12.4.2	Clocks, frequency goals.....	414
12.4.2.1	ARM Clock.....	414
12.4.2.2	Bus Clocks.....	414
12.4.2.3	Debug Clocks.....	414
12.5	Core Platform Sub-Blocks details.....	415
12.5.1	ARM Cortex A9 MPCore Processor.....	415
12.5.2	Media Processing Engine (MPE - NEON).....	415
12.5.3	Generic Interrupt Controller (GIC).....	416
12.5.3.1	Interrupt Controller Features.....	416
12.5.3.2	About the Interrupt Controller.....	416
12.5.3.3	Interrupt Controller Clock frequency.....	416
12.5.3.4	TrustZone support.....	416
12.5.4	Instruction and data caches (L1).....	417
12.5.4.1	L1 features.....	417
12.5.5	L2 Cache and controller (PL310).....	417
12.6	Debug and Trace Sub-blocks (CoreSight components).....	417
12.6.1	Debug Access Port (DAP) .....	418
12.6.2	Program Trace Macrocell (PTM).....	418
12.6.2.1	Program Flow Trace (PFT).....	419
12.6.3	Cross Trigger Interface (CTI).....	420
12.6.4	Embedded Trace Buffer (ETB).....	420
12.6.4.1	AMBA Trace Bus (ATB) Replicator .....	420

## Chapter 13

### AHB to IP Bridge (AIPSTZ)

13.1	Overview.....	421
13.1.1	Features.....	421
13.2	Clocks.....	421
13.3	General Operation.....	422
13.4	Functional Description.....	423

Section number	Title	Page
13.5	Access Protections.....	423
13.6	Access Support.....	423
13.7	Initialization Information.....	424
13.7.1	Security Block.....	424
13.8	AIPSTZ Memory Map/Register Definition.....	425
13.8.1	Master Priviledge Registers (AIPSTZ <sub>x</sub> _MPR).....	426
13.8.2	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR).....	428
13.8.3	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR1).....	431
13.8.4	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR2).....	434
13.8.5	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR3).....	437
13.8.6	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR4).....	440

## Chapter 14

### Digital Audio Multiplexer (AUDMUX)

14.1	Overview.....	443
14.1.1	Features.....	445
14.1.2	Modes and Operations.....	445
14.2	External Signals.....	445
14.3	Clocks.....	447
14.3.1	Clock Inputs.....	447
14.3.2	Clock Diagram.....	447
14.3.3	Clocking Restrictions.....	448
14.4	Default Register Configuration.....	448
14.4.1	Default Port Configuration.....	448
14.5	Functional Description.....	449
14.5.1	Operating Modes.....	449
14.5.1.1	Port Receive Data Modes.....	450
14.5.1.1.1	Normal Mode.....	451
14.5.1.1.2	Internal Network Mode.....	452
14.5.1.1.3	Transmit Data Output Enable Assertion.....	458

Section number	Title	Page
14.5.1.2	Tx/Rx Switch and External Network Mode.....	459
14.5.1.3	Timing Modes.....	460
14.5.1.3.1	Synchronous Mode (4-Wire Interface).....	460
14.5.1.3.2	Asynchronous Mode (6-Wire Interface).....	462
14.5.2	Connectivity Between Ports.....	465
14.5.2.1	Internal Port to External Port Connectivity.....	466
14.5.2.2	External Port to External Port Connectivity.....	467
14.5.2.3	Internal Port to Internal Port Connectivity.....	467
14.5.2.4	Loopback Connectivity.....	468
14.6	AUDMUX Memory Map/Register Definition.....	468
14.6.1	Port Timing Control Register 1 (AUDMUX_PTCR1).....	469
14.6.2	Port Data Control Register 1 (AUDMUX_PDCR1).....	471
14.6.3	Port Timing Control Register 2 (AUDMUX_PTCR2).....	472
14.6.4	Port Data Control Register 2 (AUDMUX_PDCR2).....	474
14.6.5	Port Timing Control Register 3 (AUDMUX_PTCR3).....	475
14.6.6	Port Data Control Register 3 (AUDMUX_PDCR3).....	477
14.6.7	Port Timing Control Register 4 (AUDMUX_PTCR4).....	478
14.6.8	Port Data Control Register 4 (AUDMUX_PDCR4).....	480
14.6.9	Port Timing Control Register 5 (AUDMUX_PTCR5).....	481
14.6.10	Port Data Control Register 5 (AUDMUX_PDCR5).....	483
14.6.11	Port Timing Control Register 6 (AUDMUX_PTCR6).....	484
14.6.12	Port Data Control Register 6 (AUDMUX_PDCR6).....	486
14.6.13	Port Timing Control Register 7 (AUDMUX_PTCR7).....	487
14.6.14	Port Data Control Register 7 (AUDMUX_PDCR7).....	489

## Chapter 15 Clock Controller Module (CCM)

15.1	Overview.....	491
15.1.1	Features.....	491
15.1.2	CCM Block Diagram.....	492

Section number	Title	Page
15.2	External Signals.....	494
15.3	CCM Clock Tree.....	494
15.4	System Clocks.....	496
15.5	Functional Description.....	500
15.5.1	Clock Generation.....	501
15.5.1.1	External Low Frequency Clock - CKIL .....	501
15.5.1.1.1	CKIL synchronizing to IPG_CLK.....	501
15.5.1.2	External High Frequency Clock - CKIH and internal oscillator.....	501
15.5.1.3	PLL reference clock.....	501
15.5.1.3.1	ARM PLL.....	502
15.5.1.3.2	USB PLLs.....	502
15.5.1.3.3	System PLL.....	502
15.5.1.3.4	Audio / Video PLL.....	502
15.5.1.3.5	Ethernet PLL.....	502
15.5.1.4	Phase Fractional Dividers (PFD).....	503
15.5.1.5	CCM internal clock generation.....	504
15.5.1.5.1	Clock Switcher.....	504
15.5.1.5.2	PLL bypass procedure.....	506
15.5.1.5.3	PLL clock change.....	506
15.5.1.5.4	Clock Root Generator.....	506
15.5.1.5.5	Initial values controlled by the System JTAG Controller (SJC).....	516
15.5.1.5.6	Divider change handshake.....	517
15.5.1.6	Disabling / Enabling PLLs.....	517
15.5.1.7	Low Power Clock Gating module (LPCG).....	517
15.5.1.7.1	MMDC handshake.....	519
15.5.2	DVFS support.....	520
15.5.3	Power modes.....	520
15.5.3.1	RUN mode.....	520

Section number	Title	Page
15.5.3.2	WAIT mode.....	520
15.5.3.2.1	Entering WAIT mode .....	520
15.5.3.2.2	Exiting WAIT mode .....	521
15.5.3.3	STOP mode.....	521
15.5.3.3.1	Entering STOP mode .....	521
15.5.3.3.2	Exiting STOP mode.....	522
15.6	CCM Memory Map/Register Definition.....	523
15.6.1	CCM Control Register (CCM_CCR).....	524
15.6.2	CCM Control Divider Register (CCM_CCDR).....	526
15.6.3	CCM Status Register (CCM_CSR).....	527
15.6.4	CCM Clock Swither Register (CCM_CCSR).....	528
15.6.5	CCM Arm Clock Root Register (CCM_CACRR).....	530
15.6.6	CCM Bus Clock Divider Register (CCM_CBCDR).....	531
15.6.7	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	533
15.6.8	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	536
15.6.9	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	539
15.6.10	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	539
15.6.11	CCM SSI1 Clock Divider Register (CCM_CS1CDR).....	542
15.6.12	CCM SSI2 Clock Divider Register (CCM_CS2CDR).....	544
15.6.13	CCM D1 Clock Divider Register (CCM_CDCDR).....	545
15.6.14	CCM HSC Clock Divider Register (CCM_CHSCCDR).....	547
15.6.15	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	548
15.6.16	CCM Serial Clock Divider Register 3 (CCM_CSCDR3).....	550
15.6.17	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	552
15.6.18	CCM Low Power Control Register (CCM_CLPCR).....	555
15.6.19	CCM Interrupt Status Register (CCM_CISR).....	558
15.6.20	CCM Interrupt Mask Register (CCM_CIMR).....	561
15.6.21	CCM Clock Output Source Register (CCM_CCOSR).....	564
15.6.22	CCM General Purpose Register (CCM_CGPR).....	566

Section number	Title	Page
15.6.23	CCM Clock Gating Register 0 (CCM_CCGR0).....	567
15.6.24	CCM Clock Gating Register 1 (CCM_CCGR1).....	569
15.6.25	CCM Clock Gating Register 2 (CCM_CCGR2).....	570
15.6.26	CCM Clock Gating Register 3 (CCM_CCGR3).....	572
15.6.27	CCM Clock Gating Register 4 (CCM_CCGR4).....	573
15.6.28	CCM Clock Gating Register 5 (CCM_CCGR5).....	574
15.6.29	CCM Clock Gating Register 6 (CCM_CCGR6).....	576
15.6.30	CCM Module Enable Override Register (CCM_CMEOR).....	577
15.7	CCM Analog Memory Map/Register Definition.....	578
15.7.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM $n$ ).....	581
15.7.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1 $n$ ).....	583
15.7.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2 $n$ ).....	585
15.7.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYS $n$ ).....	587
15.7.5	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO $n$ ).....	589
15.7.6	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)....	591
15.7.7	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	592
15.7.8	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO $n$ ).....	593
15.7.9	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM).....	595
15.7.10	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	596
15.7.11	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET $n$ ).....	597
15.7.12	480MHz Clock (from PLL_USB2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 $n$ ).....	599
15.7.13	528MHz Clock (From PLL_SYS) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528 $n$ ).....	601
15.7.14	Miscellaneous Control Register (CCM_ANALOG_MISC0 $n$ ).....	603
15.7.15	Miscellaneous Control Register (CCM_ANALOG_MISC2 $n$ ).....	604

<b>Chapter 16</b>		
<b>CMOS Sensor Interface (CSI)</b>		
16.1	Overview.....	609
16.2	External Signals.....	610
16.3	Clocks.....	611
16.4	Principles of Operation.....	612
16.4.1	Data Transfer With The Embedded DMA Controllers.....	612
16.4.2	Gated Clock Mode.....	613
16.4.3	Non-Gated Clock Mode.....	614
16.4.4	CCIR656 Interlace Mode.....	614
16.4.5	CCIR656 Progressive Mode.....	616
16.4.6	Error Correction for CCIR656 Coding.....	617
16.5	Interrupt Generation.....	618
16.5.1	Start Of Frame Interrupt (SOF_INT).....	618
16.5.2	End Of Frame Interrupt (EOF_INT).....	618
16.5.3	Change Of Field Interrupt (COF_INT).....	618
16.5.4	CCIR Error Interrupt (ECC_INT).....	619
16.5.5	RxFIFO Full Interrupt (RxFF_INT).....	619
16.5.6	Statistic FIFO Full Interrupt (STATFF_INT).....	619
16.5.7	RxFIFO Overrun Interrupt (RFF_OR_INT).....	619
16.5.8	Statistic FIFO Overrun Interrupt (SFF_OR_INT).....	619
16.5.9	Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1).....	619
16.5.10	Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2).....	620
16.5.11	Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF).....	620
16.5.12	AHB Bus Response Error Interrupt (HRESP_ERR_INT).....	620
16.6	Data Packing Style.....	620
16.6.1	RX FIFO Path.....	621
16.6.1.1	Bayer Data.....	621
16.6.1.2	RGB565 Data.....	621

Section number	Title	Page
16.6.1.3	RGB888 Data.....	622
16.6.2	STAT FIFO Path.....	624
16.7	CSI Memory Map/Register Definition.....	624
16.7.1	CSI Control Register 1 (CSI_CSICR1).....	625
16.7.2	CSI Control Register 2 (CSI_CSICR2).....	629
16.7.3	CSI Control Register 3 (CSI_CSICR3).....	631
16.7.4	CSI Statistic FIFO Register (CSI_CSISTATFIFO).....	633
16.7.5	CSI RX FIFO Register (CSI_CSIRFIFO).....	634
16.7.6	CSI RX Count Register (CSI_CSIRXCNT).....	634
16.7.7	CSI Status Register (CSI_CSISR).....	635
16.7.8	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO).....	638
16.7.9	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO).....	638
16.7.10	CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1).....	639
16.7.11	CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2).....	640
16.7.12	CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA).....	640
16.7.13	CSI Image Parameter Register (CSI_CSIIMAG_PARA).....	641

## Chapter 17 Debug Monitor (DBGMON)

17.1	Overview.....	643
17.1.1	Features Summary.....	644
17.1.2	Functional Description.....	644
17.1.3	Application.....	644
17.2	DBGMON Memory Map/Register Definition.....	645
17.2.1	HW_DBGMON_CTRL (DBGMON_HW_DBGMON_CTRL).....	646
17.2.2	HW_DBGMON_MASTER_EN (DBGMON_HW_DBGMON_MASTER_EN).....	648
17.2.3	HW_DBGMON_IRQ (DBGMON_HW_DBGMON_IRQ).....	649
17.2.4	HW_DBGMON_TRAP_ADDR_LOW (DBGMON_HW_DBGMON_TRAP_ADDR_LOW).....	650
17.2.5	HW_DBGMON_TRAP_ADDR_HIGH (DBGMON_HW_DBGMON_TRAP_ADDR_HIGH).....	651
17.2.6	HW_DBGMON_TRAP_ID (DBGMON_HW_DBGMON_TRAP_ID).....	651

Section number	Title	Page
17.2.7	HW_DBGMON_SNVS_ADDR (DBGMON_HW_DBGMON_SNVS_ADDR).....	651
17.2.8	HW_DBGMON_SNVS_DATA (DBGMON_HW_DBGMON_SNVS_DATA).....	652
17.2.9	HW_DBGMON_SNVS_INFO (DBGMON_HW_DBGMON_SNVS_INFO).....	653
17.2.10	HW_DBGMON_VERSION (DBGMON_HW_DBGMON_VERSION).....	654

## Chapter 18 Data Co-Processor (DCP)

18.1	Overview.....	655
18.1.1	DCP Limitations for Software.....	657
18.2	Clocks.....	658
18.3	Operation.....	658
18.3.1	Memory Copy, Blit, and Fill Functionality.....	659
18.3.2	Advanced Encryption Standard (AES).....	659
18.3.2.1	Key Storage.....	659
18.3.2.2	AES OTP Key.....	660
18.3.2.3	Encryption Modes.....	660
18.3.3	Hashing.....	662
18.3.4	One Time Programmable (OTP) Key.....	663
18.3.5	Managing DCP Channel Arbitration and Performance.....	663
18.3.5.1	DCP Arbitration.....	664
18.3.5.2	Channel Recovery Timers.....	664
18.3.6	Programming Channel Operations.....	665
18.3.6.1	Virtual Channels.....	665
18.3.6.2	Context Switching.....	666
18.3.6.3	Working with Semaphores.....	667
18.3.6.4	Work Packet Structure.....	668
18.3.6.4.1	Next Command Address Field.....	668
18.3.6.4.2	Control0 Field.....	669
18.3.6.4.3	Control1 Field.....	671
18.3.6.4.4	Source Buffer.....	672

Section number	Title	Page
18.3.6.4.5	Destination Buffer.....	672
18.3.6.4.6	Buffer Size Field.....	673
18.3.6.4.7	Payload Pointer.....	673
18.3.6.4.8	Status.....	673
18.3.6.4.9	Payload.....	675
18.3.7	Programming DCP Functions.....	676
18.3.7.1	Basic Memory Copy Programming Example.....	676
18.3.7.2	Basic Hash Operation Programming Example.....	677
18.3.7.3	Basic Cipher Operation Programming Example.....	679
18.3.7.4	Multi-Buffer Scatter/Gather Cipher and Hash Operation Programming Example.....	680
18.4	DCP Memory Map/Register Definition.....	683
18.4.1	DCP Control Register 0 (DCP_CTRL).....	684
18.4.2	DCP Status Register (DCP_STAT).....	687
18.4.3	DCP Channel Control Register (DCP_CHANNELCTRL).....	689
18.4.4	DCP Capability 0 Register (DCP_CAPABILITY0).....	691
18.4.5	DCP Capability 1 Register (DCP_CAPABILITY1).....	692
18.4.6	DCP Context Buffer Pointer (DCP_CONTEXT).....	693
18.4.7	DCP Key Index (DCP_KEY).....	693
18.4.8	DCP Key Data (DCP_KEYDATA).....	694
18.4.9	DCP Work Packet 0 Status Register (DCP_PACKET0).....	695
18.4.10	DCP Work Packet 1 Status Register (DCP_PACKET1).....	695
18.4.11	DCP Work Packet 2 Status Register (DCP_PACKET2).....	699
18.4.12	DCP Work Packet 3 Status Register (DCP_PACKET3).....	700
18.4.13	DCP Work Packet 4 Status Register (DCP_PACKET4).....	700
18.4.14	DCP Work Packet 5 Status Register (DCP_PACKET5).....	701
18.4.15	DCP Work Packet 6 Status Register (DCP_PACKET6).....	701
18.4.16	DCP Channel 0 Command Pointer Address Register (DCP_CH0CMDPTR).....	702
18.4.17	DCP Channel 0 Semaphore Register (DCP_CH0SEMA).....	703
18.4.18	DCP Channel 0 Status Register (DCP_CH0STAT).....	704

Section number	Title	Page
18.4.19	DCP Channel 0 Options Register (DCP_CH0OPTS).....	706
18.4.20	DCP Channel 1 Command Pointer Address Register (DCP_CH1CMDPTR).....	707
18.4.21	DCP Channel 1 Semaphore Register (DCP_CH1SEMA).....	708
18.4.22	DCP Channel 1 Status Register (DCP_CH1STAT).....	709
18.4.23	DCP Channel 1 Options Register (DCP_CH1OPTS).....	711
18.4.24	DCP Channel 2 Command Pointer Address Register (DCP_CH2CMDPTR).....	712
18.4.25	DCP Channel 2 Semaphore Register (DCP_CH2SEMA).....	713
18.4.26	DCP Channel 2 Status Register (DCP_CH2STAT).....	714
18.4.27	DCP Channel 2 Options Register (DCP_CH2OPTS).....	716
18.4.28	DCP Channel 3 Command Pointer Address Register (DCP_CH3CMDPTR).....	717
18.4.29	DCP Channel 3 Semaphore Register (DCP_CH3SEMA).....	718
18.4.30	DCP Channel 3 Status Register (DCP_CH3STAT).....	719
18.4.31	DCP Channel 3 Options Register (DCP_CH3OPTS).....	721
18.4.32	DCP Debug Select Register (DCP_DBGSELECT).....	721
18.4.33	DCP Debug Data Register (DCP_DBGDATA).....	722
18.4.34	DCP Page Table Register (DCP_PAGETABLE).....	722
18.4.35	DCP Version Register (DCP_VERSION).....	723

## Chapter 19 Enhanced Configurable SPI (ECSPI)

19.1	Overview.....	725
19.1.1	Features.....	726
19.1.2	Modes and Operations.....	726
19.2	External Signals.....	727
19.3	Clocks.....	730
19.4	Functional Description.....	730
19.4.1	Master Mode.....	731
19.4.2	Slave Mode.....	731
19.4.3	Low Power Modes.....	732

Section number	Title	Page
19.4.4	Operations.....	732
19.4.4.1	Typical Master Mode.....	732
19.4.4.1.1	Master Mode with SPI_RDY.....	733
19.4.4.1.2	Master Mode with Wait States.....	735
19.4.4.1.3	Master Mode with SS_CTL[3:0] Control.....	735
19.4.4.1.4	Master Mode with Phase Control.....	736
19.4.4.2	Typical Slave Mode.....	737
19.4.5	Reset.....	738
19.4.6	Interrupts.....	738
19.4.7	DMA .....	739
19.4.8	Byte Order.....	740
19.5	Initialization.....	741
19.6	Applications.....	741
19.7	ECSPI Memory Map/Register Definition.....	742
19.7.1	Receive Data Register (ECSPIx_RXDATA).....	744
19.7.2	Transmit Data Register (ECSPIx_TXDATA).....	745
19.7.3	Control Register (ECSPIx_CONREG).....	745
19.7.4	Config Register (ECSPIx_CONFIGREG).....	748
19.7.5	Interrupt Control Register (ECSPIx_INTREG).....	750
19.7.6	DMA Control Register (ECSPIx_DMAREG).....	751
19.7.7	Status Register (ECSPIx_STATREG).....	753
19.7.8	Sample Period Control Register (ECSPIx_PERIODREG).....	754
19.7.9	Test Control Register (ECSPIx_TESTREG).....	756
19.7.10	Message Data Register (ECSPIx_MSGDATA).....	757

## Chapter 20

### External Interface Module (EIM)

20.1	Overview.....	759
20.1.1	Features.....	761

Section number	Title	Page
20.1.2	Modes of Operation.....	761
20.1.2.1	Asynchronous Mode.....	762
20.1.2.2	Asynchronous Page Read Mode.....	762
20.1.2.3	Multiplexed Address/Data Mode.....	762
20.1.2.4	Burst Clock Mode.....	763
20.1.2.5	Low Power Modes.....	764
20.1.2.6	Boot Mode.....	764
20.2	External Signals.....	764
20.2.1	Other Important Block I/O Signals Internal to the SoC.....	769
20.3	Clocks.....	770
20.4	Chip Select Memory Map.....	770
20.5	Functional Description.....	770
20.5.1	Continuous BCLK.....	771
20.5.2	Bus Sizing Configuration.....	772
20.5.2.1	8 BIT PORT SUPPORT.....	772
20.5.2.1.1	MOTOROLA 68000.....	772
20.5.2.1.2	INTEL 386.....	773
20.5.3	EIM Operational Modes.....	773
20.5.4	Burst Mode (Synchronous) Memory Operation.....	773
20.5.5	Burst Clock Divisor (BCD).....	774
20.5.6	Burst Clock Start (BCS).....	775
20.5.7	Multiplexed Address/Data Mode Support.....	775
20.5.8	Mixed Master/Memory Burst Modes Support.....	775
20.5.9	AXI (Master) Bus Cycles Support.....	776
20.5.10	WAIT_B Signal, RWSC and WWSC bit fields Usage.....	778
20.5.11	IPS Register Interface.....	778
20.5.12	MRS Set for PSRAM.....	779
20.5.13	EIM Access Termination .....	779
20.5.14	Error Conditions.....	779

Section number	Title	Page
20.5.15	DTACK Mode.....	780
20.5.16	RDY_INT Signal as Interrupt.....	780
20.5.17	RDY_INT Signal as Ready After Reset Indication.....	781
20.5.18	EIM_GRANT / EIM_BUSY Handshake Description.....	781
20.5.19	LPMD / LPACK Handshake Description.....	781
20.5.20	Endianness.....	782
20.5.21	Strobe Signal Use.....	783
20.6	Initialization Information.....	783
20.6.1	Booting from EIM.....	783
20.7	Typical Application.....	784
20.7.1	Access to AMD Flash.....	784
20.7.1.1	AMD Flash Asynchronous Mode Configuration.....	785
20.7.1.2	AMD Flash Utility.....	785
20.7.2	Access to Intel Sibley Flash.....	786
20.7.2.1	Intel Sibley Flash Asynchronous Mode Configuration.....	786
20.7.2.2	Intel Sibley Flash Synchronous Mode Configuration.....	786
20.7.2.3	Intel Sibley Flash Utility.....	786
20.7.3	Access to MDOC Device.....	787
20.7.3.1	MDOC Device Boot.....	787
20.7.3.2	MDOC Device Asynchronous Mode Configuration.....	787
20.7.3.3	MDOC Device Utility.....	787
20.7.4	Access to Micron PSRAM .....	787
20.7.4.1	Micron PSRAM Asynchronous Mode Configuration.....	788
20.7.4.2	Micron PSRAM Synchronous Mode Configuration.....	788
20.7.5	Access to Samsung OneNAND .....	788
20.7.5.1	Samsung OneNAND Boot.....	788
20.7.5.2	Samsung OneNAND Asynchronous Mode Configuration.....	789
20.7.5.3	Samsung OneNAND Synchronous Mode Configuration.....	789
20.7.5.4	Samsung OneNAND Utility.....	789

Section number	Title	Page
20.7.6	Access to Samsung UtRAM .....	790
20.7.6.1	Samsung UtRAM Asynchronous Mode Configuration.....	790
20.7.6.2	Samsung UtRAM Synchronous Mode Configuration.....	790
20.7.7	Access to Spansion Flash .....	790
20.7.7.1	Spansion Flash Asynchronous Mode Configuration.....	790
20.7.7.2	Spansion Flash Synchronous Mode Configuration.....	791
20.7.7.3	Spansion Flash Utility.....	791
20.7.8	8 bit support.....	792
20.8	External Bus Timing Diagrams.....	793
20.8.1	Asynchronous Read Memory Accesses Timing Diagram.....	793
20.8.2	Asynchronous Write Memory Accesses Timing Diagram.....	794
20.8.3	Asynchronous Read/Write Memory Accesses Timing Diagram.....	795
20.8.4	Asynchronous Read/Write Using RAL, WAL and CSREC.....	797
20.8.5	Consecutive Asynchronous Write Memory Accesses Timing Diagram.....	798
20.8.6	Consecutive Asynchronous Read Memory Accesses Timing Diagram.....	801
20.8.7	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0.....	803
20.8.8	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1.....	804
20.8.9	Asynchronous Page Mode Access.....	805
20.8.10	DTACK Mode - AXI Single Access.....	805
20.8.11	DTACK Mode - AXI Single Write Access.....	808
20.8.12	DTACK Mode - AXI Burst Access.....	809
20.9	EIM Memory Map/Register Definition.....	810
20.9.1	Chip Select n General Configuration Register 1 (EIM_CSnGCR1).....	813
20.9.2	Chip Select n General Configuration Register 2 (EIM_CSnGCR2).....	818
20.9.3	Chip Select n Read Configuration Register 1 (EIM_CSnRCR1).....	819
20.9.4	Chip Select n Read Configuration Register 2 (EIM_CSnRCR2).....	822
20.9.5	Chip Select n Write Configuration Register 1 (EIM_CSnWCR1).....	823
20.9.6	Chip Select n Write Configuration Register 2 (EIM_CSnWCR2).....	826
20.9.7	EIM Configuration Register (EIM_WCR).....	827

Section number	Title	Page
20.9.8	DLL Control Register (EIM_DCR).....	829
20.9.9	DLL Status Register (EIM_DSR).....	830
20.9.10	EIM IP Access Register (EIM_WIAR).....	831
20.9.11	Error Address Register (EIM_EAR).....	832

## Chapter 21 Enhanced LCD Interface (eLCDIF)

21.1	Overview.....	833
21.2	External Signals.....	833
21.3	Clocks.....	835
21.4	Functional Description.....	836
21.4.1	Bus Interface Mechanisms.....	837
21.4.1.1	Bus Master Operation in Write/Display Modes.....	838
21.4.1.2	System Bus Master Performance.....	838
21.4.2	Write Data Path.....	839
21.4.3	Read Data Path.....	845
21.4.4	eLCDIF Interrupts.....	850
21.4.5	Initializing the eLCDIF.....	850
21.4.5.1	Write Modes.....	850
21.4.5.2	MPU Read Mode.....	851
21.4.6	MPU Interface.....	852
21.4.6.1	Code Example to Initialize the eLCDIF in MPU Write Mode.....	854
21.4.7	VSYNC Interface.....	854
21.4.7.1	Code Example to Initialize eLCDIF in VSYNC Mode.....	855
21.4.8	DOTCLK Interface.....	856
21.4.8.1	Code Example.....	858
21.4.9	ITU-R BT.656 Digital Video Interface (DVI).....	858
21.4.10	eLCDIF Pin Usage by Interface Mode.....	859
21.5	Behavior During Reset.....	862

Section number	Title	Page
21.6	ELCDIF Memory Map/Register Definition.....	862
21.6.1	eLCDIF General Control Register (LCDIF_CTRL $n$ ).....	865
21.6.2	eLCDIF General Control1 Register (LCDIF_CTRL1 $n$ ).....	868
21.6.3	eLCDIF General Control2 Register (LCDIF_CTRL2 $n$ ).....	870
21.6.4	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT).....	873
21.6.5	LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF).....	873
21.6.6	LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF).....	874
21.6.7	LCD Interface Timing Register (LCDIF_TIMING).....	874
21.6.8	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0 $n$ ).....	875
21.6.9	eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1).....	877
21.6.10	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2).....	877
21.6.11	eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3).....	878
21.6.12	eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4).....	879
21.6.13	Digital Video Interface Control0 Register (LCDIF_DVICTRL0).....	880
21.6.14	Digital Video Interface Control1 Register (LCDIF_DVICTRL1).....	880
21.6.15	Digital Video Interface Control2 Register (LCDIF_DVICTRL2).....	881
21.6.16	Digital Video Interface Control3 Register (LCDIF_DVICTRL3).....	882
21.6.17	Digital Video Interface Control4 Register (LCDIF_DVICTRL4).....	883
21.6.18	RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0).....	884
21.6.19	RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1).....	885
21.6.20	RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF_CSC_COEFF2).....	886
21.6.21	RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3).....	887
21.6.22	RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4).....	887
21.6.23	RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET).....	888
21.6.24	RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT).....	889
21.6.25	LCD Interface Data Register (LCDIF_DATA).....	890
21.6.26	Bus Master Error Status Register (LCDIF_BM_ERROR_STAT).....	890
21.6.27	CRC Status Register (LCDIF_CRC_STAT).....	891
21.6.28	LCD Interface Status Register (LCDIF_STAT).....	891

Section number	Title	Page
21.6.29	LCD Interface Version Register (LCDIF_VERSION).....	893
21.6.30	LCD Interface Debug0 Register (LCDIF_DEBUG0).....	894
21.6.31	LCD Interface Debug1 Register (LCDIF_DEBUG1).....	896
21.6.32	LCD Interface Debug2 Register (LCDIF_DEBUG2).....	897
21.6.33	eLCDIF Threshold Register (LCDIF_THRES).....	897

## Chapter 22

### Electrophoretic Display Controller (EPDC)

22.1	Overview .....	899
22.1.1	EPDC Block Diagram.....	900
22.2	External Signals.....	901
22.3	Programming Model.....	903
22.3.1	Assumptions.....	904
22.3.2	Register Space (Write/Set/Clear/Toggle).....	904
22.3.3	Interrupts.....	905
22.3.3.1	Interrupt Sources.....	905
22.3.3.2	Enabling/Masking Interrupts.....	905
22.3.3.3	Handling/Clearing Interrupts.....	906
22.3.4	Controller Setup.....	906
22.3.4.1	Memory Requirements.....	906
22.3.4.2	Panel Architecture Configuration.....	907
22.3.4.3	TFT Panel Timing Configuration .....	910
22.3.4.4	Source Driver and Pixel Clock Configuration.....	916
22.3.4.5	Initializing the Display.....	918
22.3.4.5.1	Reset/Clocks and Buffer Preparation.....	918
22.3.4.5.2	Performing an Initialization Display Update.....	919
22.3.5	Dual-Scan Configuration.....	919
22.3.6	Update Buffer Analysis Functions.....	923
22.3.7	Waveform Mode Selection (AUTOWV).....	924
22.3.8	Panel Interface Generator (Pigeon Mode).....	925

Section number	Title	Page
22.3.9	Display Update Programming.....	928
22.3.9.1	Initiating a Display Update.....	928
22.3.9.2	Update Processing and Collisions.....	929
22.3.9.3	Multiple Update Flow.....	933
22.3.10	Architectural Clock Gating (Low Power Mode).....	936
22.3.11	Performance Tuning and Considerations.....	938
22.3.11.1	Memory and Bus Bandwidth Requirements.....	938
22.3.11.2	Pixel Latency FIFOs.....	939
22.3.11.3	Basic Watermarking Control.....	939
22.3.11.4	Update/Refresh Tuning (VSCAN_HOLD OFF).....	940
22.3.11.5	System-Level Arbitration Control.....	940
22.4	EPDC Memory Map/Register Definition.....	942
22.4.1	EPDC Control Register (EPDC_CTRLn).....	951
22.4.2	EPDC Waveform Address Pointer (EPDC_WVADDR).....	952
22.4.3	EPDC Working Buffer Address (EPDC_WB_ADDR).....	953
22.4.4	EPDC Screen Resolution (EPDC_RES).....	954
22.4.5	EPDC Format Control Register (EPDC_FORMATn).....	954
22.4.6	EPDC FIFO control register (EPDC_FIFOCTRLn).....	956
22.4.7	EPDC Update Region Address (EPDC_UPD_ADDR).....	957
22.4.8	EPDC Update Region Stride (EPDC_UPD_STRIDE).....	958
22.4.9	EPDC Update Command Co-ordinate (EPDC_UPD_CORD).....	958
22.4.10	EPDC Update Command Size (EPDC_UPD_SIZE).....	959
22.4.11	EPDC Update Command Control (EPDC_UPD_CTRLn).....	960
22.4.12	EPDC Update Fixed Pixel Control (EPDC_UPD_FIXEDn).....	961
22.4.13	EPDC Temperature Register (EPDC_TEMP).....	962
22.4.14	Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT).....	962
22.4.15	EPDC Timing Control Engine Control Register (EPDC_TCE_CTRLn).....	963
22.4.16	EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFGn).....	965
22.4.17	EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFGn).....	966

Section number	Title	Page
22.4.18	EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1n).....	967
22.4.19	EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2n).....	967
22.4.20	EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCANn).....	968
22.4.21	EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OEn).....	968
22.4.22	EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITYn).....	969
22.4.23	EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1n).....	970
22.4.24	EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2n).....	971
22.4.25	EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3n).....	972
22.4.26	EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0n).....	972
22.4.27	EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1n).....	973
22.4.28	EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1n).....	973
22.4.29	EPDC IRQ Mask Register for LUT 32~63 (EPDC_IRQ_MASK2n).....	974
22.4.30	EPDC Interrupt Register for LUT 0~31 (EPDC_IRQ1n).....	974
22.4.31	EPDC Interrupt Registerr for LUT 32~63 (EPDC_IRQ2n).....	975
22.4.32	EPDC IRQ Mask Register (EPDC_IRQ_MASKn).....	975
22.4.33	EPDC Interrupt Register (EPDC_IRQn).....	976
22.4.34	EPDC Status Register - LUTs (EPDC_STATUS_LUTS1n).....	977
22.4.35	EPDC Status Register - LUTs (EPDC_STATUS_LUTS2n).....	978
22.4.36	EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT).....	978
22.4.37	EPDC LUT Collision Status (EPDC_STATUS_COL1n).....	980
22.4.38	EPDC LUT Collision Status (EPDC_STATUS_COL2n).....	981
22.4.39	EPDC General Status Register (EPDC_STATUSn).....	981
22.4.40	EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD).....	983
22.4.41	EPDC Collision Region Size (EPDC_UPD_COL_SIZE).....	984
22.4.42	1-level Histogram Parameter Register. (EPDC_HIST1_PARAM).....	984
22.4.43	2-level Histogram Parameter Register. (EPDC_HIST2_PARAM).....	985
22.4.44	4-level Histogram Parameter Register. (EPDC_HIST4_PARAM).....	986
22.4.45	8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0).....	986
22.4.46	8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1).....	987

Section number	Title	Page
22.4.47	16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0).....	988
22.4.48	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1).....	989
22.4.49	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM2).....	990
22.4.50	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM3).....	990
22.4.51	EPDC General Purpose I/O Debug register (EPDC_GPION).....	991
22.4.52	EPDC Version Register (EPDC_VERSION).....	992
22.4.53	Panel Interface Signal Generator Register 0_0 (EPDC_PIGEON_0_0).....	993
22.4.54	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_1).....	994
22.4.55	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_2).....	995
22.4.56	Panel Interface Signal Generator Register 1_0 (EPDC_PIGEON_1_0).....	995
22.4.57	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_1).....	996
22.4.58	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_2).....	997
22.4.59	Panel Interface Signal Generator Register 2_0 (EPDC_PIGEON_2_0).....	998
22.4.60	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_1).....	999
22.4.61	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_2).....	999
22.4.62	Panel Interface Signal Generator Register 3_0 (EPDC_PIGEON_3_0).....	1000
22.4.63	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_1).....	1001
22.4.64	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_2).....	1002
22.4.65	Panel Interface Signal Generator Register 4_0 (EPDC_PIGEON_4_0).....	1002
22.4.66	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_1).....	1004
22.4.67	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_2).....	1004
22.4.68	Panel Interface Signal Generator Register 5_0 (EPDC_PIGEON_5_0).....	1005
22.4.69	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_1).....	1006
22.4.70	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_2).....	1007
22.4.71	Panel Interface Signal Generator Register 6_0 (EPDC_PIGEON_6_0).....	1007
22.4.72	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_1).....	1008
22.4.73	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_2).....	1009
22.4.74	Panel Interface Signal Generator Register 7_0 (EPDC_PIGEON_7_0).....	1010
22.4.75	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_1).....	1011

Section number	Title	Page
22.4.76	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_2).....	1011
22.4.77	Panel Interface Signal Generator Register 8_0 (EPDC_PIGEON_8_0).....	1012
22.4.78	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_1).....	1013
22.4.79	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_2).....	1014
22.4.80	Panel Interface Signal Generator Register 9_0 (EPDC_PIGEON_9_0).....	1014
22.4.81	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_1).....	1016
22.4.82	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_2).....	1016
22.4.83	Panel Interface Signal Generator Register 10_0 (EPDC_PIGEON_10_0).....	1017
22.4.84	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_1).....	1018
22.4.85	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_2).....	1019
22.4.86	Panel Interface Signal Generator Register 11_0 (EPDC_PIGEON_11_0).....	1019
22.4.87	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_1).....	1020
22.4.88	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_2).....	1021
22.4.89	Panel Interface Signal Generator Register 12_0 (EPDC_PIGEON_12_0).....	1022
22.4.90	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_1).....	1023
22.4.91	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_2).....	1023
22.4.92	Panel Interface Signal Generator Register 13_0 (EPDC_PIGEON_13_0).....	1024
22.4.93	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_1).....	1025
22.4.94	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_2).....	1026
22.4.95	Panel Interface Signal Generator Register 14_0 (EPDC_PIGEON_14_0).....	1026
22.4.96	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_1).....	1028
22.4.97	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_2).....	1028
22.4.98	Panel Interface Signal Generator Register 15_0 (EPDC_PIGEON_15_0).....	1029
22.4.99	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_1).....	1030
22.4.100	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_2).....	1031
22.4.101	EPDC Working Buffer Address for TCE (EPDC_WB_ADDR_TCE).....	1031

Section number	Title	Page
<b>Chapter 23</b>		
<b>Enhanced Periodic Interrupt Timer (EPIT)</b>		
23.1	Overview.....	1033
23.1.1	EPIT features.....	1033
23.1.2	EPIT modes and operations.....	1034
23.2	External signals.....	1034
23.3	Clocks.....	1034
23.4	Functional Description.....	1036
23.4.1	Operating modes.....	1036
23.4.1.1	Operating in set-and-forget mode.....	1036
23.4.1.2	Operating in free-running mode.....	1036
23.4.2	Operations.....	1037
23.4.3	Compare Event.....	1037
23.4.3.1	Counter Value Overwrite.....	1038
23.4.3.2	Low-Power Mode Behavior.....	1039
23.4.3.3	Debug Mode Behavior.....	1039
23.5	Initialization/ Application Information.....	1039
23.5.1	Change of Clock Source.....	1039
23.6	EPIT Memory Map/Register Definition.....	1040
23.6.1	Control register (EPIT <sub>x</sub> _CR).....	1040
23.6.2	Status register (EPIT <sub>x</sub> _SR).....	1043
23.6.3	Load register (EPIT <sub>x</sub> _LR).....	1044
23.6.4	Compare register (EPIT <sub>x</sub> _CMPR).....	1044
23.6.5	Counter register (EPIT <sub>x</sub> _CNR).....	1045
<b>Chapter 24</b>		
<b>Fast Ethernet Controller (FEC)</b>		
24.1	Overview.....	1047
24.1.1	Features.....	1049
24.2	External Signals.....	1050

Section number	Title	Page
24.3	Clocks.....	1050
24.4	Modes of Operation.....	1050
24.4.1	Full- and Half-Duplex Operation.....	1050
24.4.2	Interface Options.....	1051
24.4.2.1	10 Mbps and 100 Mbps RMII Interface.....	1051
24.4.2.2	10-Mbps 7-Wire Interface Operation.....	1051
24.4.3	Address Recognition Options.....	1051
24.4.4	Internal Loopback.....	1052
24.5	Functional Description.....	1052
24.5.1	Network Interface Options.....	1052
24.5.2	FEC Frame Transmission.....	1053
24.5.2.1	Transmit Inter-Packet Gap (IPG) Time.....	1054
24.5.2.2	Collision Handling.....	1054
24.5.2.3	Transmission Error Handling.....	1055
24.5.2.3.1	Transmitter Underrun .....	1055
24.5.2.3.2	Retransmission Attempts Limit Expired .....	1055
24.5.2.3.3	Late Collision .....	1056
24.5.2.3.4	Heartbeat .....	1056
24.5.3	FEC Frame Reception.....	1056
24.5.3.1	Receive Inter-Packet Gap (IPG) Time.....	1057
24.5.3.2	Ethernet Address Recognition.....	1057
24.5.3.2.1	Hash Algorithm.....	1060
24.5.3.3	Reception Error Handling.....	1063
24.5.3.3.1	Overflow .....	1063
24.5.3.3.2	Non-Octet (Dribbling Bits) .....	1063
24.5.3.3.3	CRC .....	1063
24.5.3.3.4	Frame Length Violation.....	1064
24.5.3.3.5	Truncation.....	1064
24.5.4	Full-Duplex Flow Control.....	1064

Section number	Title	Page
24.5.5	Internal and External Loopback.....	1065
24.6	Initialization/Application Information.....	1066
24.6.1	Initialization Sequence.....	1066
24.6.1.1	Hardware Controlled Initialization.....	1066
24.6.1.2	User Initialization (Prior to Asserting FEC_ECR[ETHER_EN]).....	1067
24.6.1.3	Microcontroller Initialization.....	1068
24.6.1.4	User Initialization (after asserting FEC_ECR[ETHER_EN]).....	1068
24.6.2	Buffer Descriptors.....	1068
24.6.2.1	Driver/DMA Operation with Buffer Descriptors.....	1069
24.6.2.2	Ethernet Transmit Buffer Descriptor (TxBD).....	1069
24.6.2.2.1	Driver/DMA Operation with Transmit Buffer Descriptors.....	1071
24.6.2.2.1.1	Transmit Frame in Multiple Buffers.....	1071
24.6.2.3	Ethernet Receive Buffer Descriptor (RxBD).....	1072
24.6.2.3.1	Driver/DMA Operation with Receive Buffer Descriptors.....	1073
24.7	Programmable Registers.....	1074
24.7.1	Top Level Block Memory Map.....	1074
24.7.2	Message Information Block (MIB) Counters Memory Map.....	1075
24.7.3	MIIGSK Registers Memory Map.....	1077
24.8	FEC Memory Map/Register Definition.....	1077
24.8.1	Ethernet interrupt event register (FEC_EIR).....	1079
24.8.2	Ethernet interrupt mask register (FEC_EIMR).....	1081
24.8.3	Receive descriptor active register (FEC_RDAR).....	1084
24.8.4	Transmit descriptor active register (FEC_TDAR).....	1085
24.8.5	Ethernet control register (FEC_ECR).....	1086
24.8.6	MII management frame register (FEC_MMFR).....	1087
24.8.7	MII speed control register (FEC_MSCR).....	1088
24.8.8	MIB control register (FEC_MIBC).....	1090
24.8.9	Receive control register (FEC_RCR).....	1091
24.8.10	Transmit control register (FEC_TCR).....	1093

Section number	Title	Page
24.8.11	Physical address low register (FEC_PALR).....	1095
24.8.12	Physical address upper register (FEC_PAUR).....	1095
24.8.13	Opcode and pause duration register (FEC_OPDR).....	1096
24.8.14	Descriptor individual address upper register (FEC_IAUR).....	1097
24.8.15	Descriptor individual address lower register (FEC_IALR).....	1097
24.8.16	Descriptor group address upper register (FEC_GAUR).....	1098
24.8.17	Descriptor group address lower register (FEC_GALR).....	1098
24.8.18	Transmit FIFO watermark register (FEC_TFWR).....	1099
24.8.19	FIFO receive bound register (FEC_FRBR).....	1100
24.8.20	FIFO receive FIFO start registers (FEC_FRSR).....	1100
24.8.21	Receive buffer descriptor ring start register (FEC_ERDSR).....	1101
24.8.22	Transmit buffer descriptor ring start register (FEC_ETDSR).....	1102
24.8.23	Maximum receive buffer size register (FEC_EMRBR).....	1102

## Chapter 25

### General Power Controller (GPC)

25.1	Overview.....	1105
25.2	Clocks.....	1106
25.3	DVFS overview.....	1106
25.3.1	Features.....	1108
25.4	Component Blocks description.....	1109
25.4.1	dvfs_stdb_smpl block.....	1109
25.4.2	dvfs_sig_wt block.....	1109
25.4.3	dvfs_pre_avg block.....	1110
25.4.4	dvfs_ld_add block.....	1112
25.4.5	dvfs_ema_avg block.....	1113
25.4.6	dvfs_thres_cmp block.....	1117
25.4.7	dvfs_thresh_count block.....	1118
25.4.8	Load Tracking Buffer Register.....	1119
25.4.9	Frequency Pattern Generator.....	1119

Section number	Title	Page
25.5	DVFS output event/interrupt configuration.....	1121
25.5.1	Interrupts.....	1121
25.5.2	DVFS Change Request Sequence Diagrams.....	1121
25.6	Power Gating Control (PGC).....	1122
25.6.1	Overview.....	1123
25.6.1.1	Features.....	1124
25.7	GPC Interrupt Controller (INTC).....	1124
25.7.1	Interrupt Controller features.....	1124
25.8	GPC Memory Map/Register Definition.....	1125
25.8.1	GPC Interface control register (GPC_CNTR).....	1125
25.8.2	GPC Power Gating Register (GPC_PGR).....	1128
25.8.3	IRQ masking register 1 (GPC_IMR1).....	1128
25.8.4	IRQ masking register 2 (GPC_IMR2).....	1129
25.8.5	IRQ masking register 3 (GPC_IMR3).....	1129
25.8.6	IRQ masking register 4 (GPC_IMR4).....	1130
25.8.7	IRQ status resister 1 (GPC_ISR1).....	1130
25.8.8	IRQ status resister 2 (GPC_ISR2).....	1131
25.8.9	IRQ status resister 3 (GPC_ISR3).....	1131
25.8.10	IRQ status resister 4 (GPC_ISR4).....	1132
25.9	PGC Memory Map/Register Definition.....	1132
25.9.1	PGC Control Register (PGC_DISPLAY_CTRL).....	1133
25.9.2	Power Up Sequence Control Register (PGC_DISPLAY_PUPSCR).....	1134
25.9.3	Pull Down Sequence Control Register (PGC_DISPLAY_PDNSCR).....	1135
25.9.4	Power Gating Controller Status Register (PGC_DISPLAY_SR).....	1135
25.9.5	PGC Control Register (PGC_GPU_CTRL).....	1136
25.9.6	Power Up Sequence Control Register (PGC_GPU_PUPSCR).....	1137
25.9.7	Pull Down Sequence Control Register (PGC_GPU_PDNSCR).....	1137
25.9.8	Power Gating Controller Status Register (PGC_GPU_SR).....	1138
25.9.9	PGC Control Register (PGC_CPU_CTRL).....	1139

Section number	Title	Page
25.9.10	Power Up Sequence Control Register (PGC_CPU_PUPSCR).....	1139
25.9.11	Pull Down Sequence Control Register (PGC_CPU_PDNSCR).....	1140
25.9.12	Power Gating Controller Status Register (PGC_CPU_SR).....	1141
25.10	DVFS Memory Map/Register Definition.....	1141
25.10.1	DVFS Thresholds (DVFS_THRS).....	1142
25.10.2	DVFS Counters thresholds (DVFS_COUN).....	1143
25.10.3	DVFS general purpose bits weight (DVFS_SIG1).....	1143
25.10.4	DVFS general purpose bits weight (DVFS_DVFS_SIG0).....	1144
25.10.5	DVFS general purpose bit 0 weight counter (DVFS_DVFSGPC0).....	1145
25.10.6	DVFS general purpose bit 1 weight counter (DVFS_DVFSGPC1).....	1146
25.10.7	DVFS general purpose bits enables (DVFS_DVFSGPBT).....	1147
25.10.8	DVFS EMAC settings (DVFS_DVFS_MAC).....	1149
25.10.9	DVFS Control (DVFS_CNTR).....	1150
25.10.10	DVFS Load Tracking Register 0, portion 0 (DVFS_DVFSLTR0_0).....	1153
25.10.11	DVFS Load Tracking Register 0, portion 1 (DVFS_DVFSLTR0_1).....	1154
25.10.12	DVFS Load Tracking Register 1, portion 0 (DVFS_DVFSLTR1_0).....	1155
25.10.13	DVFS Load Tracking Register 3, portion 1 (DVFS_DVFSLTR1_1).....	1155
25.10.14	DVFS pattern 0 length (DVFS_DVFSPT0).....	1156
25.10.15	DVFS pattern 1 length (DVFS_DVFSPT1).....	1157
25.10.16	DVFS pattern 2 length (DVFS_DVFSPT2).....	1157
25.10.17	DVFS pattern 3 length (DVFS_DVFSPT3).....	1158

## Chapter 26

### General Purpose Input/Output (GPIO)

26.1	Overview.....	1159
26.1.1	Block Diagram.....	1161
26.1.2	Features.....	1162
26.2	External Signals.....	1163
26.3	Clocks.....	1167

Section number	Title	Page
26.4	GPIO Functional Description.....	1167
26.4.1	GPIO Function.....	1167
26.4.2	GPIO Programming.....	1168
26.4.2.1	GPIO Read Mode.....	1168
26.4.2.2	GPIO Write Mode.....	1168
26.4.3	Interrupt Control Unit.....	1169
26.5	GPIO Memory Map/Register Definition.....	1169
26.5.1	GPIO data register (GPIOx_DR).....	1171
26.5.2	GPIO direction register (GPIOx_GDIR).....	1172
26.5.3	GPIO pad status register (GPIOx_PSR).....	1172
26.5.4	GPIO interrupt configuration register1 (GPIOx_ICR1).....	1173
26.5.5	GPIO interrupt configuration register2 (GPIOx_ICR2).....	1177
26.5.6	GPIO interrupt mask register (GPIOx_IMR).....	1180
26.5.7	GPIO interrupt status register (GPIOx_ISR).....	1181
26.5.8	GPIO edge select register (GPIOx_EDGE_SEL).....	1182

## Chapter 27 General Purpose Timer (GPT)

27.1	Overview.....	1183
27.1.1	Features.....	1185
27.1.2	Modes and Operation.....	1185
27.2	External Signals.....	1185
27.2.1	External Clock Input .....	1186
27.2.2	Input Capture Trigger Signals .....	1186
27.2.3	Output Compare Signals.....	1187
27.3	Clocks.....	1187
27.4	Functional Description.....	1189
27.4.1	Operating Modes.....	1189
27.4.1.1	Restart Mode.....	1189
27.4.1.2	Free-Run Mode.....	1189

Section number	Title	Page
27.4.2	Operation.....	1190
27.4.2.1	Input Capture.....	1190
27.4.2.2	Output Compare.....	1191
27.4.2.3	Interrupts.....	1192
27.4.2.4	Low Power Mode Behavior.....	1193
27.4.2.5	Debug Mode Behavior.....	1193
27.5	Initialization/ Application Information .....	1193
27.5.1	Selecting the Clock Source .....	1193
27.6	GPT Memory Map/Register Definition.....	1194
27.6.1	GPT Control Register (GPT_CR).....	1195
27.6.2	GPT Prescaler Register (GPT_PR).....	1199
27.6.3	GPT Status Register (GPT_SR).....	1200
27.6.4	GPT Interrupt Register (GPT_IR).....	1201
27.6.5	GPT Output Compare Register 1 (GPT_OCR1).....	1202
27.6.6	GPT Output Compare Register 2 (GPT_OCR2).....	1203
27.6.7	GPT Output Compare Register 3 (GPT_OCR3).....	1203
27.6.8	GPT Input Capture Register 1 (GPT_ICR1).....	1204
27.6.9	GPT Input Capture Register 2 (GPT_ICR2).....	1204
27.6.10	GPT Counter Register (GPT_CNT).....	1205

## Chapter 28

### 2D Graphics Processing Unit (GPU2D)

28.1	Overview.....	1207
28.2	GPU2D Block Diagram.....	1207
28.2.1	R2D GPU.....	1207
28.2.2	V2D GPU.....	1208
28.3	GPU2D Features.....	1209
28.3.1	Full Featured R2D GPU Pipeline.....	1209
28.3.2	Full Featured V2D GPU Pipeline.....	1210

Section number	Title	Page
28.4	GPU2D OPERATIONS.....	1210
28.4.1	R2D GPU Operations.....	1210
28.4.1.1	Line.....	1210
28.4.1.2	Rectangle Fill and Clear.....	1211
28.4.1.3	BitBLT.....	1211
28.4.1.4	Stretch BLT.....	1212
28.4.1.5	Monochrome Expansion and Mask BLT.....	1212
28.4.1.5.1	Monochrome expansion .....	1213
28.4.1.5.2	Mask BLT.....	1213
28.4.1.6	Filter BLT.....	1213
28.4.1.7	R2D Performance of different operations.....	1214
28.4.1.8	Rotation.....	1215
28.4.1.9	Transparency Mode.....	1215
28.4.1.10	Clipping.....	1215
28.4.1.11	R2D GPU Data Formats.....	1215
28.4.1.12	ARGB Data Conversion of R2D GPU.....	1216
28.4.1.13	YUV to RGB Conversion of R2D GPU.....	1216
28.4.1.14	Color Index Input Conversion Support of R2D GPU.....	1217
28.4.1.15	Source/Destination Pre-multiply and De-Multiply Support.....	1217
28.4.1.16	Alpha Blending.....	1218
28.4.1.17	GPU Cache Management.....	1219
28.4.2	V2D GPU Operations.....	1220
28.4.2.1	OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION.....	1220
28.4.2.2	Advantages of Using OpenVG.....	1220
28.4.2.3	OpenVG Target Applications.....	1220
28.4.2.4	OpenVG Features.....	1220
28.4.2.4.1	Core API .....	1220
28.4.2.4.2	The VGU Utility Library .....	1221
28.4.2.4.3	OpenVG Rendering Pipeline.....	1221

Section number	Title	Page
<b>Chapter 29</b>		
<b>I2C Controller (I2C)</b>		
29.1	Overview.....	1223
29.1.1	Features.....	1225
29.1.2	Modes and operations.....	1226
29.2	External Signals.....	1226
29.3	Clocks.....	1227
29.4	Functional description.....	1227
29.4.1	I2C system configuration.....	1227
29.4.2	Arbitration procedure.....	1228
29.4.3	Clock synchronization.....	1228
29.4.4	Handshaking.....	1229
29.4.5	Clock stretching.....	1229
29.4.6	Peripheral bus accesses.....	1230
29.4.7	Generation of transfer error on IP bus.....	1230
29.4.8	Reset.....	1230
29.4.9	Interrupts.....	1230
29.4.10	Byte order.....	1230
29.5	Initialization.....	1231
29.5.1	Initialization sequence.....	1231
29.5.2	Generation of Start.....	1231
29.5.3	Post-transfer software response.....	1231
29.5.4	Generation of Stop.....	1232
29.5.5	Generation of Repeated Start.....	1232
29.5.6	Slave mode.....	1233
29.5.7	Arbitration lost.....	1233
29.6	Software restriction.....	1239
29.7	I2C Memory Map/Register Definition.....	1240
29.7.1	I2C Address Register (I2Cx_IADR).....	1241

Section number	Title	Page
29.7.2	I2C Frequency Divider Register (I2Cx_IFDR).....	1241
29.7.3	I2C Control Register (I2Cx_I2CR).....	1243
29.7.4	I2C Status Register (I2Cx_I2SR).....	1244
29.7.5	I2C Data I/O Register (I2Cx_I2DR).....	1246

## Chapter 30 IOMUX Controller (IOMUXC)

30.1	Overview.....	1247
30.1.1	Features.....	1248
30.2	Clocks.....	1249
30.3	Functional description.....	1249
30.3.1	ALT6 and ALT7 extended muxing modes.....	1250
30.3.2	SW Loopback through SION bit.....	1251
30.3.3	Daisy chain - multi pads driving same module input pin.....	1251
30.4	IOMUXC Memory Map/Register Definition.....	1252
30.4.1	GPR0 (IOMUXC_GPR0).....	1277
30.4.2	GPR1 (IOMUXC_GPR1).....	1279
30.4.3	GPR2 (IOMUXC_GPR2).....	1281
30.4.4	GPR3 (IOMUXC_GPR3).....	1284
30.4.5	GPR4 (IOMUXC_GPR4).....	1288
30.4.6	GPR5 (IOMUXC_GPR5).....	1290
30.4.7	GPR6 (IOMUXC_GPR6).....	1291
30.4.8	GPR7 (IOMUXC_GPR7).....	1291
30.4.9	GPR8 (IOMUXC_GPR8).....	1292
30.4.10	GPR9 (IOMUXC_GPR9).....	1292
30.4.11	GPR10 (IOMUXC_GPR10).....	1293
30.4.12	GPR11 (IOMUXC_GPR11).....	1295
30.4.13	GPR12 (IOMUXC_GPR12).....	1296
30.4.14	GPR13 (IOMUXC_GPR13).....	1297
30.4.15	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_MCLK).....	1299

Section number	Title	Page
30.4.16	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_RXC).....	1300
30.4.17	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_RXD).....	1301
30.4.18	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_RXFS).....	1302
30.4.19	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_TXC).....	1303
30.4.20	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_TXD).....	1304
30.4.21	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_AUD_TXFS).....	1305
30.4.22	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP11_MISO).....	1306
30.4.23	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP11_MOSI).....	1307
30.4.24	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP11_SCLK).....	1308
30.4.25	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP11_SS0).....	1309
30.4.26	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP12_MISO).....	1310
30.4.27	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP12_MOSI).....	1311
30.4.28	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP12_SCLK).....	1312
30.4.29	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ECSP12_SS0).....	1313
30.4.30	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR0).....	1314
30.4.31	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_BDR1).....	1315
30.4.32	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA00).....	1316
30.4.33	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA01).....	1317
30.4.34	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA10).....	1318
30.4.35	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA11).....	1319
30.4.36	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA12).....	1320
30.4.37	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA13).....	1321
30.4.38	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA14).....	1322
30.4.39	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA15).....	1323
30.4.40	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA02).....	1324
30.4.41	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA03).....	1325
30.4.42	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA04).....	1326
30.4.43	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA05).....	1327
30.4.44	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA06).....	1328

Section number	Title	Page
30.4.45	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA07).....	1329
30.4.46	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA08).....	1330
30.4.47	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_DATA09).....	1331
30.4.48	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDCLK).....	1332
30.4.49	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDOE).....	1333
30.4.50	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDRL).....	1334
30.4.51	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_GDSP).....	1335
30.4.52	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_COM).....	1336
30.4.53	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL0).....	1337
30.4.54	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL1).....	1338
30.4.55	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL2).....	1339
30.4.56	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_CTRL3).....	1340
30.4.57	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_IRQ).....	1341
30.4.58	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_STAT).....	1342
30.4.59	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_PWR_WAKE).....	1343
30.4.60	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE0).....	1344
30.4.61	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE1).....	1345
30.4.62	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE2).....	1346
30.4.63	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCE3).....	1347
30.4.64	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDCLK).....	1348
30.4.65	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDLE).....	1349
30.4.66	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDOE).....	1350
30.4.67	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_SDSHR).....	1351
30.4.68	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_VCOM0).....	1352
30.4.69	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_EPDC_VCOM1).....	1353
30.4.70	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_CRS_DV).....	1354
30.4.71	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_MDC).....	1355
30.4.72	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_MDIO).....	1356
30.4.73	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_REF_CLK).....	1357

Section number	Title	Page
30.4.74	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_RX_ER).....	1358
30.4.75	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_RX_DATA0).....	1359
30.4.76	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_RX_DATA1).....	1360
30.4.77	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_TX_CLK).....	1361
30.4.78	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_TX_EN).....	1362
30.4.79	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_TX_DATA0).....	1363
30.4.80	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_FEC_TX_DATA1).....	1364
30.4.81	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_USB_H_DATA).....	1365

## Chapter 32

### Multi Mode DDR Controller (MMDC)

32.1	Overview.....	1995
32.1.1	MMDC feature summary.....	1996
32.2	External Signals.....	1999
32.3	Clocks.....	2000
32.4	Functional Description.....	2000
32.4.1	Write/Read data flow.....	2000
32.4.1.1	Write data flow.....	2000
32.4.1.2	Read data flow.....	2001
32.4.2	MMDC initialization .....	2001
32.4.3	Configuring the MMDC registers.....	2003
32.4.4	MMDC Address Space.....	2003
32.4.4.1	Address decoding .....	2003
32.4.4.2	Chip select settings.....	2006
32.4.4.2.1	Creating 4 Gbyte address space with 2 Gbyte CS density.....	2006
32.4.4.2.2	Creating 2 Gbyte address spaces with 1 Gbyte CS density.....	2007
32.4.4.3	Translation of AXI accesses to DDR accessess.....	2007
32.4.4.3.1	Example .....	2008
32.4.4.4	Address mirroring .....	2008
32.4.5	LPDDR2 and DDR3 pin mux mapping.....	2009
32.4.6	Power Saving and Clock Frequency Change modes.....	2010
32.4.6.1	Power saving general.....	2010
32.4.6.2	Self refresh and Frequency change entry/exit.....	2011
32.4.7	Reset .....	2013
32.4.7.1	Hard reset.....	2013
32.4.7.2	Warm reset.....	2013
32.4.7.3	Software reset .....	2014
32.4.8	Refresh Scheme.....	2014

Section number	Title	Page
32.4.9	Burst Length options towards DDR .....	2015
32.4.10	Exclusive accesses handling.....	2015
32.4.11	AXI Error Handling.....	2017
32.5	Performance.....	2017
32.5.1	Arbitration and reordering mechanism.....	2017
32.5.1.1	Arbitration General.....	2017
32.5.1.2	Real time channel mode.....	2018
32.5.1.3	Dynamic scoring mode (Arbitration Winning Conditions).....	2018
32.5.1.4	Guarding (aging) mechanism.....	2019
32.5.2	Prediction mechanism.....	2019
32.5.3	Special Optimization for accesses towards DDR3.....	2020
32.6	MMDC Debug .....	2021
32.6.1	Hardware debug monitor.....	2021
32.6.2	Step By Step (SBS) software monitor.....	2021
32.7	MMDC Profiling.....	2022
32.8	LPDDR2 Refresh Rate Update and Timing Derating.....	2023
32.9	DLL Off mode.....	2024
32.10	ODT Configuration .....	2025
32.11	Calibration Process.....	2026
32.11.1	delay-line.....	2027
32.11.2	ZQ calibration .....	2028
32.11.2.1	ZQ automatic (hardware) calibration process.....	2029
32.11.2.1.1	ZQ automatic Pull-up calibration.....	2029
32.11.2.1.2	ZQ automatic Pull-down calibration.....	2030
32.11.2.2	ZQ software calibration process.....	2030
32.11.2.3	ZQ calibration commands .....	2030
32.11.3	Read DQS Gating Calibration.....	2031
32.11.3.1	Hardware DQS Gating Calibration.....	2031
32.11.3.1.1	Hardware DQS Calibration with MPR.....	2031

Section number	Title	Page
32.11.3.1.2	Hardware DQS Calibration with pre-defined value.....	2032
32.11.3.2	SW read DQS gating Calibration.....	2034
32.11.3.2.1	SW read Calibration with MPR.....	2034
32.11.3.2.2	SW read Calibration with pre-defined value.....	2035
32.11.4	Read Calibration.....	2037
32.11.4.1	Hardware (automatic) Read Calibration.....	2037
32.11.4.1.1	Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2).....	2038
32.11.4.1.2	Hardware (automatic) Calibration with pre-defined value.....	2038
32.11.4.2	SW Read Calibration.....	2040
32.11.4.2.1	Calibration with MPR(DDR3)/DQ calibration(LPDDR2).....	2040
32.11.4.2.2	Calibration with pre-defined value.....	2040
32.11.5	Write Calibration.....	2042
32.11.5.1	HW (automatic) Write Calibration.....	2042
32.11.5.2	SW Write Calibration.....	2043
32.11.6	Write leveling Calibration.....	2045
32.11.6.1	Hardware Write Leveling Calibration.....	2046
32.11.6.2	SW Write Leveling Calibration.....	2047
32.11.7	Write fine tuning.....	2048
32.11.8	Read fine tuning.....	2049
32.12	MMDC Memory Map/Register Definition.....	2049
32.12.1	MMDC Core Control Register (MMDC_MDCTL).....	2053
32.12.2	MMDC Core Power Down Control Register (MMDC_MDPDC).....	2055
32.12.3	MMDC Core ODT Timing Control Register (MMDC_MDOTC).....	2057
32.12.4	MMDC Core Timing Configuration Register 0 (MMDC_MDCFG0).....	2059
32.12.5	MMDC Core Timing Configuration Register 1 (MMDC_MDCFG1).....	2061
32.12.6	MMDC Core Timing Configuration Register 2 (MMDC_MDCFG2).....	2063
32.12.7	MMDC Core Miscellaneous Register (MMDC_MDMISC).....	2065
32.12.8	MMDC Core Special Command Register (MMDC_MDSCR).....	2068

Section number	Title	Page
32.12.9	MMDC Core Refresh Control Register (MMDC_MDREF).....	2071
32.12.10	MMDC Core Read/Write Command Delay Register (MMDC_MDRWD).....	2073
32.12.11	MMDC Core Out of Reset Delays Register (MMDC_MDOR).....	2075
32.12.12	MMDC Core MRR Data Register (MMDC_MDMRR).....	2076
32.12.13	MMDC Core Timing Configuration Register 3 (MMDC_MDCFG3LP).....	2077
32.12.14	MMDC Core MR4 Derating Register (MMDC_MDMR4).....	2079
32.12.15	MMDC Core Address Space Partition Register (MMDC_MDASP).....	2081
32.12.16	MMDC Core AXI Reordering Control Regsiter (MMDC_MAARCR).....	2082
32.12.17	MMDC Core Power Saving Control and Status Register (MMDC_MAPSR).....	2084
32.12.18	MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0).....	2086
32.12.19	MMDC Core Exclusive ID Monitor Register1 (MMDC_MAEXIDR1).....	2087
32.12.20	MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0).....	2088
32.12.21	MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1).....	2089
32.12.22	MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0).....	2090
32.12.23	MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1).....	2090
32.12.24	MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2).....	2091
32.12.25	MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3).....	2091
32.12.26	MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4).....	2092
32.12.27	MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5).....	2092
32.12.28	MMDC Core Step By Step Address Register (MMDC_MASBS0).....	2093
32.12.29	MMDC Core Step By Step Address Attributes Register (MMDC_MASBS1).....	2093
32.12.30	MMDC Core General Purpose Register (MMDC_MAGENP).....	2094
32.12.31	MMDC PHY ZQ HW control register (MMDC_MPZQHWCTRL).....	2095
32.12.32	MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL).....	2098
32.12.33	MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCRC).....	2100
32.12.34	MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0).....	2103
32.12.35	MMDC PHY Write Leveling Delay Control Register 1 (MMDC_MPWLDECTRL1).....	2105
32.12.36	MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDLST).....	2108
32.12.37	MMDC PHY ODT control register (MMDC_MPODTCTRL).....	2110

Section number	Title	Page
32.12.38	MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL).....	2112
32.12.39	MMDC PHY Read DQ Byte1 Delay Register (MMDC_MPRDDQBY1DL).....	2115
32.12.40	MMDC PHY Read DQ Byte2 Delay Register (MMDC_MPRDDQBY2DL).....	2118
32.12.41	MMDC PHY Read DQ Byte3 Delay Register (MMDC_MPRDDQBY3DL).....	2120
32.12.42	MMDC PHY Write DQ Byte0 Delay Register (MMDC_MPWRDQBY0DL).....	2123
32.12.43	MMDC PHY Write DQ Byte1 Delay Register (MMDC_MPWRDQBY1DL).....	2125
32.12.44	MMDC PHY Write DQ Byte2 Delay Register (MMDC_MPWRDQBY2DL).....	2127
32.12.45	MMDC PHY Write DQ Byte3 Delay Register (MMDC_MPWRDQBY3DL).....	2130
32.12.46	MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0).....	2132
32.12.47	MMDC PHY Read DQS Gating Control Register 1 (MMDC_MPDGCTRL1).....	2134
32.12.48	MMDC PHY Read DQS Gating delay-line Status Register (MMDC_MPDGDLST0).....	2137
32.12.49	MMDC PHY Read delay-lines Configuration Register (MMDC_MPRDDLCTL).....	2138
32.12.50	MMDC PHY Read delay-lines Status Register (MMDC_MPRDDLST).....	2140
32.12.51	MMDC PHY Write delay-lines Configuration Register (MMDC_MPWRDLCTL).....	2141
32.12.52	MMDC PHY Write delay-lines Status Register (MMDC_MPWRDLST).....	2142
32.12.53	MMDC PHY CK Control Register (MMDC_MPSDCTRL).....	2143
32.12.54	MMDC ZQ LPDDR2 HW Control Register (MMDC_MPZQLP2CTL).....	2144
32.12.55	MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL).....	2146
32.12.56	MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL).....	2148
32.12.57	MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0).....	2149
32.12.58	MMDC PHY Read Delay HW Calibration Status Register 1 (MMDC_MPRDDLHWST1).....	2150
32.12.59	MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC_MPWRDLHWST0).....	2151
32.12.60	MMDC PHY Write Delay HW Calibration Status Register 1 (MMDC_MPWRDLHWST1).....	2152
32.12.61	MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR).....	2153
32.12.62	MMDC PHY Read DQS Gating HW Status Register 0 (MMDC_MPDGHWST0).....	2153
32.12.63	MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1).....	2154
32.12.64	MMDC PHY Read DQS Gating HW Status Register 2 (MMDC_MPDGHWST2).....	2154
32.12.65	MMDC PHY Read DQS Gating HW Status Register 3 (MMDC_MPDGHWST3).....	2155
32.12.66	MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1).....	2156

Section number	Title	Page
32.12.67	MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2).....	2157
32.12.68	MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0).....	2159
32.12.69	MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0).....	2160
32.12.70	MMDC PHY SW Dummy Read Data Register 1 (MMDC_MPSWDRDR1).....	2161
32.12.71	MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2).....	2161
32.12.72	MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3).....	2161
32.12.73	MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4).....	2162
32.12.74	MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5).....	2162
32.12.75	MMDC PHY SW Dummy Read Data Register 6 (MMDC_MPSWDRDR6).....	2163
32.12.76	MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7).....	2163
32.12.77	MMDC PHY Measure Unit Register (MMDC_MPMUR0).....	2164
32.12.78	MMDC Write CA delay-line controller (MMDC_MPWRCADL).....	2165
32.12.79	MMDC Duty Cycle Control Register (MMDC_MPDCCR).....	2167

## Chapter 33

### Network Interconnect Bus System (NIC-301)

33.1	Overview .....	2169
33.2	Block diagram.....	2169
33.2.1	NIC-301 Main Features.....	2170
33.2.2	Modes and Operations.....	2170
33.3	External Signals.....	2170
33.4	Memory Map and Register Definition.....	2170
33.4.1	Memory Map.....	2171
33.4.2	Configuration programmers model.....	2171
33.4.2.1	Address control and ID registers.....	2172
33.4.2.2	AMBA master interface block (AMIB) configuration registers.....	2172
33.4.2.3	ASIB (AMBA slave interface block) configuration registers.....	2172
33.4.3	Register Descriptions.....	2173
33.4.4	NIC Specific Parameters.....	2173

## Chapter 34

### On-Chip OTP Controller (OCOTP\_CTRL)

34.1	Overview.....	2175
34.1.1	Features.....	2175
34.2	Clocks.....	2175
34.3	Top-Level Symbol and Functional Overview.....	2176
34.3.1	Operation.....	2176
34.3.1.1	Shadow Register Reload.....	2177
34.3.1.2	Fuse and Shadow register read.....	2177
34.3.1.3	Fuse and Shadow Register Writes.....	2178
34.3.1.4	Write Postamble.....	2179
34.3.2	Fuse Shadow Memory Footprint.....	2180
34.3.3	OTP Read/Write Timing Parameters.....	2182
34.3.4	Hardware Visible Fuses.....	2183
34.3.5	Behavior During Reset.....	2183
34.3.6	Secure JTAG control.....	2183
34.4	Fuse Map.....	2184
34.5	OCOTP Memory Map/Register Definition.....	2184
34.5.1	OTP Controller Control Register (OCOTP_CTRLn).....	2188
34.5.2	OTP Controller Timing Register (OCOTP_TIMING).....	2190
34.5.3	OTP Controller Write Data Register (OCOTP_DATA).....	2190
34.5.4	OTP Controller Write Data Register (OCOTP_READ_CTRL).....	2191
34.5.5	OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA).....	2192
34.5.6	Sticky bit Register (OCOTP_SW_STICKY).....	2192
34.5.7	Software Controllable Signals Register (OCOTP_SCSn).....	2194
34.5.8	OTP Controller CRC test address (OCOTP_CRC_ADDR).....	2195
34.5.9	OTP Controller CRC Value Register (OCOTP_CRC_VALUE).....	2195
34.5.10	OTP Controller Timing Register (OCOTP_UMC_TIMING).....	2196
34.5.11	OTP Controller Version Register (OCOTP_VERSION).....	2196

Section number	Title	Page
34.5.12	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK).....	2197
34.5.13	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0).....	2200
34.5.14	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1).....	2200
34.5.15	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2).....	2201
34.5.16	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3).....	2201
34.5.17	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4).....	2202
34.5.18	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5).....	2202
34.5.19	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6).....	2203
34.5.20	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0).....	2203
34.5.21	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1).....	2204
34.5.22	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2).....	2204
34.5.23	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3).....	2205
34.5.24	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4).....	2205
34.5.25	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0).....	2206
34.5.26	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1).....	2206
34.5.27	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2).....	2207
34.5.28	Shadow Register for OTP Bank2 Word0 (DCP and CRYPTO Key) (OCOTP_DCP0).....	2207
34.5.29	Shadow Register for OTP Bank2 Word1 (DCP and CRYPTO Key) (OCOTP_DCP1).....	2208
34.5.30	Shadow Register for OTP Bank2 Word2 (DCP and CRYPTO Key) (OCOTP_DCP2).....	2208
34.5.31	Shadow Register for OTP Bank2 Word3 (DCP and CRYPTO Key) (OCOTP_DCP3).....	2209
34.5.32	Shadow Register for OTP Bank2 Word4 (DCP Key) (OCOTP_DCP4).....	2209
34.5.33	Shadow Register for OTP Bank2 Word5 (DCP Key) (OCOTP_DCP5).....	2210
34.5.34	Shadow Register for OTP Bank2 Word6 (DCP Key) (OCOTP_DCP6).....	2210
34.5.35	Shadow Register for OTP Bank2 Word7 (DCP Key) (OCOTP_DCP7).....	2211
34.5.36	Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0).....	2211
34.5.37	Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1).....	2212
34.5.38	Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2).....	2212
34.5.39	Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3).....	2213
34.5.40	Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4).....	2213

Section number	Title	Page
34.5.41	Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5).....	2214
34.5.42	Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6).....	2214
34.5.43	Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7).....	2215
34.5.44	Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_SJC_RESP0).....	2215
34.5.45	Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_SJC_RESP1).....	2216
34.5.46	Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0).....	2217
34.5.47	Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1).....	2217
34.5.48	Value of OTP Bank4 Word4 (HW Capabilities) (OCOTP_CRC0).....	2218
34.5.49	Value of OTP Bank4 Word5 (HW Capabilities) (OCOTP_CRC1).....	2218
34.5.50	Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1).....	2219
34.5.51	Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2).....	2219
34.5.52	Value of OTP Bank5 Word0 (HW Capabilities) (OCOTP_SW_GP0).....	2220
34.5.53	Value of OTP Bank5 Word1 (HW Capabilities) (OCOTP_SW_GP1).....	2220
34.5.54	Value of OTP Bank5 Word2 (HW Capabilities) (OCOTP_SW_GP2).....	2221
34.5.55	Value of OTP Bank5 Word3 (HW Capabilities) (OCOTP_SW_GP3).....	2221
34.5.56	Value of OTP Bank5 Word4 (HW Capabilities) (OCOTP_SW_GP4).....	2222
34.5.57	Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF).....	2222
34.5.58	Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN).....	2223
34.5.59	Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE).....	2223
34.5.60	Value of OTP Bank6 Word0 (HW Capabilities) (OCOTP_GP_LO0).....	2224
34.5.61	Value of OTP Bank6 Word1 (HW Capabilities) (OCOTP_GP_LO1).....	2224
34.5.62	Value of OTP Bank6 Word2 (HW Capabilities) (OCOTP_GP_LO2).....	2225
34.5.63	Value of OTP Bank6 Word3 (HW Capabilities) (OCOTP_GP_LO3).....	2225
34.5.64	Value of OTP Bank6 Word4 (HW Capabilities) (OCOTP_GP_LO4).....	2226
34.5.65	Value of OTP Bank6 Word5 (HW Capabilities) (OCOTP_GP_LO5).....	2226
34.5.66	Value of OTP Bank6 Word6 (HW Capabilities) (OCOTP_GP_LO6).....	2227
34.5.67	Value of OTP Bank6 Word7 (HW Capabilities) (OCOTP_GP_LO7).....	2227
34.5.68	Value of OTP Bank7 Word0 (HW Capabilities) (OCOTP_GP_HI0).....	2228
34.5.69	Value of OTP Bank7 Word1 (HW Capabilities) (OCOTP_GP_HI1).....	2228

Section number	Title	Page
34.5.70	Value of OTP Bank7 Word2 (HW Capabilities) (OCOTP_GP_HI2).....	2229
34.5.71	Value of OTP Bank7 Word3 (HW Capabilities) (OCOTP_GP_HI3).....	2229
34.5.72	Value of OTP Bank7 Word4 (HW Capabilities) (OCOTP_GP_HI4).....	2230
34.5.73	Value of OTP Bank7 Word5 (HW Capabilities) (OCOTP_GP_HI5).....	2230
34.5.74	Value of OTP Bank7 Word6 (HW Capabilities) (OCOTP_GP_HI6).....	2231
34.5.75	Value of OTP Bank7 Word7 (HW Capabilities) (OCOTP_GP_HI7).....	2231

## Chapter 35 On-Chip RAM Memory Controller (OCRAM)

35.1	Overview.....	2233
35.2	Basic Functions.....	2234
35.2.1	Read/Write Arbitration.....	2234
35.2.2	TrustZone.....	2235
35.3	Advanced Features.....	2235
35.3.1	Read Data Wait State.....	2235
35.3.2	Read Address Pipeline.....	2236
35.3.3	Write Data Pipeline.....	2236
35.3.4	Write Address Pipeline.....	2237
35.4	Programmable Registers.....	2237

## Chapter 36 Power Management Unit (PMU)

36.1	Overview.....	2239
36.2	Digital LDO Regulators.....	2241
36.3	Analog LDO Regulators.....	2242
36.3.1	LDO 1P1.....	2242
36.3.2	LDO 2P5.....	2243
36.3.2.1	Low Power Operation.....	2243
36.4	USB LDO Regulator.....	2244
36.5	SNVS Regulator.....	2244

Section number	Title	Page
36.6	Power Modes.....	2244
36.6.1	Reverse Well Biasing.....	2245
36.7	PMU Memory Map/Register Definition.....	2245
36.7.1	Digital Regulator Core Register (PMU_REG_CORE).....	2246
36.7.2	Miscellaneous Register 0 (PMU_MISC0).....	2249
36.7.3	Miscellaneous Register 1 (PMU_MISC1n).....	2252
36.7.4	Miscellaneous Control Register (PMU_MISC2n).....	2255

## Chapter 37

### Pulse Width Modulation (PWM)

37.1	Overview.....	2259
37.2	External Signals.....	2260
37.3	Clocks.....	2261
37.4	Functional Description.....	2262
37.4.1	Operation.....	2263
37.4.1.1	FIFO.....	2263
37.4.1.2	Rollover and Compare Event.....	2264
37.4.1.3	Low Power Mode Behavior.....	2264
37.4.1.4	Debug Mode Behavior.....	2264
37.5	Enable Sequence for the PWM.....	2264
37.6	Disable Sequence for the PWM.....	2265
37.7	PWM Memory Map/Register Definition.....	2265
37.7.1	PWM Control Register (PWMx_PWMCR).....	2267
37.7.2	PWM Status Register (PWMx_PWMSR).....	2269
37.7.3	PWM Interrupt Register (PWMx_PWMIR).....	2270
37.7.4	PWM Sample Register (PWMx_PWMSAR).....	2271
37.7.5	PWM Period Register (PWMx_PWMPR).....	2272
37.7.6	PWM Counter Register (PWMx_PWMCNR).....	2273

Section number	Title	Page
<b>Chapter 38</b>		
<b>Pixel Pipeline (PXP)</b>		
38.1	Overview.....	2275
38.2	Clocks.....	2276
38.3	Top-level architecture.....	2276
38.3.1	Processing Details.....	2278
38.3.2	Scaling Operation.....	2279
38.3.3	Decimation Image Scaling.....	2280
38.3.4	Bilinear Image Scaling Filter .....	2282
38.3.5	YUV 4:2:2 Image Scaling.....	2284
38.3.6	YUV 4:2:0 Image Scaling.....	2285
38.3.7	RGB/YUV444 Image Scaling.....	2287
38.3.8	Color Space Conversion (CSC).....	2287
38.3.9	CSC1 Operation.....	2288
38.3.10	YUV versus YCbCr Support.....	2289
38.3.11	CSC2 operation.....	2289
38.3.12	Alpha Blending/Color Key .....	2289
38.3.13	Alpha Blend.....	2290
38.3.14	Color Key.....	2291
38.3.15	LUT.....	2291
38.3.16	Lookup Modes.....	2292
38.3.17	DIRECT_Y8.....	2292
38.3.18	DIRECT_RGB444.....	2292
38.3.19	DIRECT_RGB454.....	2292
38.3.20	CACHE_RGB565.....	2293
38.3.21	Output Modes.....	2294
38.3.22	Y8 .....	2294
38.3.23	RGBW4444CFA.....	2295
38.3.23.1	CFA Correction.....	2295

Section number	Title	Page
38.3.24	RGB888.....	2296
38.3.25	Rotation.....	2296
38.3.26	Output Buffer.....	2299
38.3.27	Address calculator.....	2299
38.3.28	Block size selection.....	2299
38.3.29	Interlaced Video Support.....	2299
38.3.30	LCDIF Handshake.....	2300
38.3.31	LCDIF Abort.....	2303
38.3.32	Theory of Operation.....	2303
38.3.33	Pixel Handling.....	2304
38.3.34	Output Buffer Composition.....	2305
38.3.35	PS Image Processing.....	2305
38.3.36	Letterboxing.....	2306
38.3.37	Clipping source images.....	2306
38.3.38	Color Key Processing.....	2308
38.3.39	In Place Processing (PS buffer is destination buffer).....	2310
38.3.40	Alpha Surface (AS) Processing.....	2310
38.3.41	Alpha Handling.....	2310
38.3.42	Color Key Processing (AS_CTRL).....	2310
38.4	Output Image Processing.....	2311
38.4.1	Output Image Size.....	2311
38.4.2	Output Format.....	2311
38.4.3	Rotation/Flip operations.....	2311
38.5	Queuing PXP transactions.....	2312
38.6	Error Handling.....	2312
38.6.1	Known PXP Limitations/Issues.....	2313
38.7	PXP Memory Map/Register Definition.....	2313
38.7.1	Control Register 0 (PXP_CTRL).....	2316
38.7.2	Status Register (PXP_STAT).....	2318

Section number	Title	Page
38.7.3	Output Buffer Control Register (PXP_OUT_CTRL).....	2320
38.7.4	Output Frame Buffer Pointer (PXP_OUT_BUF).....	2322
38.7.5	Output Frame Buffer Pointer #2 (PXP_OUT_BUF2).....	2323
38.7.6	Output Buffer Pitch (PXP_OUT_PITCH).....	2323
38.7.7	Output Surface Lower Right Coordinate (PXP_OUT_LRC).....	2324
38.7.8	Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC).....	2325
38.7.9	Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC).....	2326
38.7.10	Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC).....	2327
38.7.11	Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC).....	2328
38.7.12	Processed Surface (PS) Control Register (PXP_PS_CTRL).....	2329
38.7.13	PS Input Buffer Address (PXP_PS_BUF).....	2331
38.7.14	PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF).....	2331
38.7.15	PS V/Cr Input Buffer Address (PXP_PS_VBUF).....	2332
38.7.16	Processed Surface Pitch (PXP_PS_PITCH).....	2333
38.7.17	PS Background Color (PXP_PS_BACKGROUND).....	2334
38.7.18	PS Scale Factor Register (PXP_PS_SCALE).....	2334
38.7.19	PS Scale Offset Register (PXP_PS_OFFSET).....	2336
38.7.20	PS Color Key Low (PXP_PS_CLRKEYLOW).....	2336
38.7.21	PS Color Key High (PXP_PS_CLRKEYHIGH).....	2337
38.7.22	Alpha Surface Control (PXP_AS_CTRL).....	2338
38.7.23	Alpha Surface Buffer Pointer (PXP_AS_BUF).....	2340
38.7.24	Alpha Surface Pitch (PXP_AS_PITCH).....	2341
38.7.25	Overlay Color Key Low (PXP_AS_CLRKEYLOW).....	2341
38.7.26	Overlay Color Key High (PXP_AS_CLRKEYHIGH).....	2342
38.7.27	Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0).....	2343
38.7.28	Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1).....	2344
38.7.29	Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2).....	2345
38.7.30	Color Space Conversion Control Register. (PXP_CSC2_CTRL).....	2346
38.7.31	Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0).....	2347

Section number	Title	Page
38.7.32	Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1).....	2348
38.7.33	Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2).....	2348
38.7.34	Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3).....	2349
38.7.35	Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4).....	2350
38.7.36	Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5).....	2350
38.7.37	Lookup Table Control Register. (PXP_LUT_CTRL).....	2351
38.7.38	Lookup Table Control Register. (PXP_LUT_ADDR).....	2353
38.7.39	Lookup Table Data Register. (PXP_LUT_DATA).....	2355
38.7.40	Lookup Table External Memory Address Register. (PXP_LUT_EXTMEM).....	2355
38.7.41	Color Filter Array Register. (PXP_CFA).....	2356
38.7.42	Histogram Control Register. (PXP_HIST_CTRL).....	2356
38.7.43	2-level Histogram Parameter Register. (PXP_HIST2_PARAM).....	2357
38.7.44	4-level Histogram Parameter Register. (PXP_HIST4_PARAM).....	2358
38.7.45	8-level Histogram Parameter 0 Register. (PXP_HIST8_PARAM0).....	2359
38.7.46	8-level Histogram Parameter 1 Register. (PXP_HIST8_PARAM1).....	2360
38.7.47	16-level Histogram Parameter 0 Register. (PXP_HIST16_PARAM0).....	2361
38.7.48	16-level Histogram Parameter 1 Register. (PXP_HIST16_PARAM1).....	2362
38.7.49	16-level Histogram Parameter 2 Register. (PXP_HIST16_PARAM2).....	2363
38.7.50	16-level Histogram Parameter 3 Register. (PXP_HIST16_PARAM3).....	2364
38.7.51	PXP Power Control Register. (PXP_POWER).....	2365
38.7.52	Next Frame Pointer (PXP_NEXT).....	2366

## Chapter 39

### Random Number Generator (RNGB)

39.1	Introduction.....	2369
39.1.1	Block Diagram.....	2369
39.1.2	Features.....	2370
39.2	Modes of Operation.....	2370
39.2.1	Self Test Mode.....	2370
39.2.2	Seed Generation Mode.....	2370

Section number	Title	Page
39.2.3	Random Number Generation Mode.....	2371
39.2.4	Verification Mode.....	2371
39.3	Memory Map/Register Definition.....	2371
39.3.1	RNGB Version ID Register (RNG_VER).....	2372
39.3.2	RNGB Command Register (RNG_CMD).....	2373
39.3.3	RNGB Control Register (RNG_CR).....	2374
39.3.4	RNGB Status Register (RNG_SR).....	2376
39.3.5	RNGB Error Status Register (RNG_ESR).....	2378
39.3.6	RNGB Output FIFO (RNG_OUT).....	2380
39.3.7	RNGB Entropy Register (RNG_ER).....	2380
39.3.8	Verification Control Register (RNG_VCR).....	2381
39.3.9	XKEY Data (RNG_XKEY).....	2382
39.3.10	Oscillator Counter Control Register (RNG_OCCR).....	2383
39.3.11	Oscillator Counter (RNG_OSC_CNT).....	2383
39.3.12	Oscillator Counter Status (RNG_OSC_CNT_STAT).....	2384
39.4	Functional Description.....	2384
39.4.1	Pseudorandom Number Generator (PRNG).....	2385
39.4.2	True Random Number Generator (TRNG).....	2385
39.4.3	Resets.....	2385
39.4.3.1	Power-on/Hardware Reset.....	2386
39.4.3.2	Software Reset.....	2386
39.4.4	RNG Interrupts.....	2386
39.5	Initialization/Application Information.....	2387
39.5.1	Manual Seeding.....	2387
39.5.2	Automatic Seeding.....	2388
39.5.3	Deterministic Mode.....	2388
39.5.4	Oscillator Frequency Verification.....	2388

Section number	Title	Page
<b>Chapter 40</b>		
<b>ROM Controller with Patch (ROMC)</b>		
40.1	Overview.....	2391
40.1.1	Features.....	2392
40.1.2	Modes of Operation.....	2392
40.1.2.1	Low Power Mode.....	2393
40.2	Clocks.....	2393
40.3	Memory Map.....	2393
40.3.1	ROM Memory Map in detail.....	2393
40.4	Functional Description.....	2394
40.4.1	ROM Controller (ROMC) Functional Description.....	2394
40.4.1.1	Functionality overview.....	2394
40.4.2	ROMC Functional Description.....	2394
40.4.2.1	ROMC Disabling.....	2395
40.4.2.2	ROMC Event Priority.....	2395
40.4.2.3	Data Fixing.....	2395
40.4.2.4	Opcode Patching.....	2396
40.4.2.4.1	Typical Software Response to Opcode Patch.....	2397
40.4.2.5	External Boot Feature.....	2398
40.4.2.6	Alternate Masters and ROMC.....	2399
40.5	ROMCP Memory Map/Register Definition.....	2399
40.5.1	ROMC Data Registers (ROMC_ROMPATCHnD).....	2400
40.5.2	ROMC Control Register (ROMC_ROMPATCHCNTL).....	2401
40.5.3	ROMC Enable Register High (ROMC_ROMPATCHENH).....	2402
40.5.4	ROMC Enable Register Low (ROMC_ROMPATCHENL).....	2402
40.5.5	ROMC Address Registers (ROMC_ROMPATCHnA).....	2403
40.5.6	ROMC Status Register (ROMC_ROMPATCHSR).....	2404

## Chapter 41

### Smart Direct Memory Access Controller (SDMA)

41.1	Overview.....	2407
41.1.1	Block Diagram.....	2407
41.1.2	Features.....	2409
41.2	External Signals.....	2411
41.3	Clocks.....	2411
41.4	Functional Description.....	2411
41.4.1	SDMA Core.....	2414
41.4.1.1	SDMA Core Structure.....	2414
41.4.1.2	Program Control Unit (PCU).....	2417
41.4.1.2.1	Instruction Types.....	2417
41.4.1.2.2	PCU States.....	2418
41.4.1.3	SDMA Core Memory.....	2421
41.4.2	Scheduler.....	2421
41.4.2.1	Primary Functions.....	2421
41.4.2.2	Channels and DMA Requests.....	2422
41.4.2.2.1	Channels.....	2422
41.4.2.2.2	DMA Requests.....	2422
41.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	2422
41.4.2.3	Scheduler Functional Description.....	2422
41.4.2.3.1	Scheduler Overview.....	2422
41.4.2.3.2	DMA Requests Scanning.....	2423
41.4.2.3.3	Mapping DMA Requests to Pending Channels.....	2424
41.4.2.3.4	Channel Overflow.....	2427
41.4.2.3.5	Runnable Channels Evaluation.....	2427
41.4.2.3.6	Next Channel Decision Tree.....	2429
41.4.2.3.7	Scheduler State Diagram.....	2431
41.4.2.3.8	Scheduler Pipeline Timing Diagram.....	2433

Section number	Title	Page
41.4.2.3.9	Channel-DMA Request Mapping.....	2433
41.4.2.3.10	Examples: How to Start a Channel.....	2433
41.4.2.4	Context Switching.....	2434
41.4.2.4.1	Context Switch Modes.....	2435
41.4.2.4.2	Context Switch Procedure.....	2435
41.4.2.4.3	Context Map in Memory.....	2437
41.4.3	Functional Units.....	2437
41.4.3.1	Burst DMA Unit.....	2437
41.4.3.1.1	Burst DMA Structure.....	2438
41.4.3.1.2	Burst DMA Registers.....	2439
41.4.3.1.3	Burst DMA Data Transfers.....	2440
41.4.3.1.3.1	Data Retrieval from the ARM platform Memory.....	2440
41.4.3.1.3.2	Storing Data Into the ARM platform Memory.....	2440
41.4.3.1.3.3	Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit.....	2441
41.4.3.2	Peripheral DMA Unit.....	2441
41.4.3.2.1	Peripheral DMA Structure.....	2442
41.4.3.2.2	Peripheral DMA Registers.....	2443
41.4.3.2.3	Peripheral DMA Data Transfers.....	2444
41.4.3.2.3.1	Data Retrieval from the ARM platform Memory or Peripheral.....	2444
41.4.3.2.3.2	Storing Data into the ARM platform Memory or Peripheral...	2444
41.4.3.2.3.3	Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit.....	2445
41.4.4	SDMA Security Support.....	2445
41.4.4.1	Locked Mode.....	2445
41.4.5	OnCE and PCU Debug States.....	2446
41.4.6	SDMA Clocks and Low Power Modes.....	2448
41.4.6.1	Clock Gating and Low Power Modes.....	2449
41.4.6.1.1	Coarse Clock Gating.....	2449

Section number	Title	Page
41.4.6.1.2	Refined Clock Gating.....	2450
41.4.6.1.3	Low Power Modes and User Control.....	2450
41.4.6.1.3.1	SLEEP Mode.....	2451
41.4.6.1.3.2	RUN Mode.....	2451
41.4.6.1.3.3	DEBUG Mode.....	2452
41.4.6.1.4	Stop Mode Response.....	2452
41.4.6.2	Reset.....	2452
41.4.7	Software Interface.....	2452
41.4.8	Initialization Information.....	2453
41.4.8.1	Hardware Reset.....	2453
41.4.8.2	Channel Script Execution.....	2454
41.4.8.3	Initialization and Script Execution Setup Sequence.....	2454
41.4.9	SDMA Programming Model.....	2455
41.4.9.1	State and Registers Per Channel.....	2455

41.10.18	Channel 0 Boot Address (SDMACORE_MCHN0ADDR).....	2640
41.10.19	ENDIAN Status Register (SDMACORE_ENDIANNES).....	2641
41.10.20	Lock Status Register (SDMACORE_SDMA_LOCK).....	2642
41.10.21	External DMA Requests Mirror #2 (SDMACORE_EVENTS2).....	2643
41.11	SDMA Peripheral Registers.....	2643

## Chapter 42

### SiPix Display Controller (SPDC)

42.1	Overview.....	2645
42.1.1	Features.....	2645
42.1.2	Block Diagram.....	2646
42.2	External Signals.....	2646
42.2.1	Chip Level Connection.....	2647
42.2.1.1	Source/Gate Start Pulse (XDIO/YDIO) Connection.....	2647
42.2.1.2	Clock and Reset Signal Connection.....	2648
42.2.2	Chip Level Pinout List.....	2649
42.2.3	Display Function Timing Description.....	2651
42.2.3.1	Source Driver Timing.....	2651
42.2.3.2	Gate Driver Timing.....	2652
42.3	Software Programming Model.....	2653
42.3.1	SPDC Initial Setup Programming.....	2653
42.3.1.1	Working Memory and Bus Bandwidth Requirements.....	2654
42.3.1.1.1	SPDC Working Memory Buffer.....	2654
42.3.1.1.1.1	GRAY MODE.....	2654

Section number	Title	Page
42.3.1.1.1.2	COLOR MODE.....	2655
42.3.1.1.2	Bus Bandwidth Calculation.....	2656
42.3.1.2	Reading SiPix EPD Driving Waveform LUT.....	2656
42.3.1.3	SiPix EPD Panel Power Sequence Control.....	2657
42.3.1.4	SPDC System Clock Configuration.....	2657
42.3.1.5	Clock Gating Architecture Configuration.....	2659
42.3.1.6	Interrupts Configuration.....	2660
42.3.1.6.1	Interrupt Sources.....	2660
42.3.1.6.2	Enable and Disable Interrupts.....	2660
42.3.1.6.3	Handle and Clear Interrupts.....	2660
42.3.1.7	Initial Configuration Command Sequence.....	2660
42.3.2	Display Update Programming.....	2661
42.3.2.1	Basic Waveform Mode Introduction.....	2661
42.3.2.1.1	Mode 0 - Gray refresh mode with flashing.....	2662
42.3.2.1.2	Mode 1 - Gray refresh mode without flashing.....	2662
42.3.2.1.3	Mode 2 - Text mode.....	2663
42.3.2.1.4	Mode 4 - High speed handwriting mode.....	2664
42.3.2.2	Initiating a Display Flow in Normal and High Speed Handwriting Mode.....	2665
42.3.2.3	Concurrent Update.....	2666
42.4	SPDC Memory Map/Register Definition.....	2666
42.4.1	Display Trigger (SPDC_DISP_TRIGGER).....	2668
42.4.2	Display Coordinate (SPDC_UPDATE_X_Y).....	2669
42.4.3	Display Area Size (SPDC_UPDATE_W_H).....	2669
42.4.4	LUT Parameter Update (SPDC_LUT_PARA_UPDATE).....	2670
42.4.5	Display Normal Operation (SPDC_OPERATE).....	2670
42.4.6	SPDC Initial Setting (SPDC_PANEL_INIT_SET).....	2671
42.4.7	Environment Temperature (SPDC_TEMPER_SETTING).....	2674
42.4.8	Next Frame Memory Address (SPDC_NEXT_BUF).....	2675
42.4.9	Current Frame Memory Address (SPDC_CURRENT_BUF).....	2675

Section number	Title	Page
42.4.10	Previous Frame Memory Address (SPDC_PREVIOUS_BUFF).....	2676
42.4.11	Counter Frame Memory Address (SPDC_FRM_CNT_BUFF).....	2676
42.4.12	LUT Memory Address (SPDC_LUT_BUFF).....	2676
42.4.13	Interrupt Enable (SPDC_INT_EN).....	2677
42.4.14	Interrupt Status & Clear (SPDC_INT_ST_CLR).....	2678
42.4.15	SPDC Operation Status (SPDC_STATUS).....	2680
42.4.16	Panel Type Related Information (SPDC_PANEL_TYPE_VER).....	2681
42.4.17	SPDC IP Version (SPDC_TCON_VER).....	2682
42.4.18	All Clock Gating Enable (SPDC_SW_GATE_CLK).....	2683

## Chapter 43 System JTAG Controller (SJC)

43.1	Overview.....	2685
43.1.1	Features.....	2687
43.1.2	Modes of Operation.....	2687
43.2	External Signals.....	2689
43.2.1	External Signal Overview.....	2690
43.2.2	TAP Controller.....	2691
43.2.3	Accessing ExtraDebug Registers.....	2693
43.3	TAP Selection Block (TSB).....	2695
43.3.1	Select Mode Using Software.....	2696
43.4	Boundary Scan Register (BSR).....	2697
43.5	SoC JTAG Instruction Register (SJIR).....	2697
43.5.1	ID_CODE Instruction (IDCODE).....	2698
43.5.2	SAMPLE/PRELOAD Instruction.....	2699
43.5.3	EXTEST Instruction.....	2699
43.5.4	HIGHZ Instruction.....	2700
43.5.5	BYPASS Instruction.....	2700
43.5.6	ENABLE_ExtraDebug Instruction.....	2701
43.5.7	ENTER_DEBUG instruction.....	2701

Section number	Title	Page
43.5.8	TAP Select Instruction.....	2701
43.5.9	EXTEST_PULSE instruction.....	2702
43.5.10	EXTEST_TRAIN instruction.....	2702
43.6	Security.....	2702
43.6.1	JTAG Security Modes.....	2703
43.6.1.1	Mode 1: No Debug - Maximum Security.....	2703
43.6.1.2	Mode 2: Secure JTAG - High Security.....	2704
43.6.1.2.1	Challenge/Response Mechanism in System JTAG Mode.....	2704
43.6.1.3	Mode 3: JTAG Enabled - Low Security.....	2705
43.6.2	Software Enabled JTAG.....	2705
43.6.3	Kill Trace.....	2706
43.6.4	SJC Disable Fuse.....	2707
43.7	Functional Description.....	2708
43.7.1	Static Core Debug.....	2708
43.7.2	Reset Mechanism.....	2708
43.8	Initialization/Application Information.....	2709
43.9	SJC Memory Map/Register Definition.....	2710
43.9.1	General Purpose Unsecured Status Register 1 (SJC_GPUSR1).....	2711
43.9.2	General Purpose Unsecured Status Register 2 (SJC_GPUSR2).....	2713
43.9.3	General Purpose Unsecured Status Register 3 (SJC_GPUSR3).....	2713
43.9.4	General Purpose Secured Status Register (SJC_GPSSR).....	2714
43.9.5	Debug Control Register (SJC_DCR).....	2715
43.9.6	Security Status Register (SJC_SSR).....	2717
43.9.7	General Purpose Clocks Control Register (SJC_GPCCR).....	2720

## Chapter 44 Secure Non-Volatile Storage (SNVS)

44.1	SNVS overview.....	2721
44.1.1	SNVS features.....	2722
44.1.2	Modes of operation.....	2723

Section number	Title	Page
44.2	External Signals.....	2724
44.3	Clocks.....	2724
44.4	SNVS structure.....	2724
44.4.1	SNVS_HP (high power domain).....	2725
44.4.2	Non-secure real time counter.....	2726
44.4.2.1	Calibrating the time counter.....	2726
44.4.2.2	Time counter alarm.....	2727
44.4.2.3	Periodic interrupt.....	2727
44.5	SNVS_LP (low power domain).....	2727
44.5.1	Behavior during system power down.....	2728
44.5.2	Secure real time counter (SRTC).....	2728
44.5.2.1	Calibrating the SRTC time counter.....	2728
44.5.2.2	Time counter alarm (zmk).....	2728
44.5.3	Monotonic counter (MC).....	2729
44.6	SNVS reset and system power up.....	2730
44.6.1	PMIC Interface.....	2730
44.7	SNVS interrupts, alarms, and security violations.....	2732
44.8	Programming Guidelines.....	2732
44.8.1	RTC/SRTC control bits setting.....	2732
44.8.2	RTC/SRTC value read.....	2734
44.8.3	General initialization guidelines.....	2734
44.9	SNVS Memory Map/Register Definition.....	2734
44.9.1	SNVS_HP Lock Register (SNVS_HPLR).....	2737
44.9.2	SNVS_HP Command Register (SNVS_HPCOMR).....	2739
44.9.3	SNVS_HP Control Register (SNVS_HPCR).....	2741
44.9.4	SNVS_HP Status Register (SNVS_HPSR).....	2744
44.9.5	SNVS_HP Real Time Counter MSB Register (SNVS_HPRTCMR).....	2746
44.9.6	SNVS_HP Real Time Counter LSB Register (SNVS_HPRTCLR).....	2747
44.9.7	SNVS_HP Time Alarm MSB Register (SNVS_HPTAMR).....	2747

Section number	Title	Page
44.9.8	SNVS_HP Time Alarm LSB Register (SNVS_HPTALR).....	2748
44.9.9	SNVS_LP Lock Register (SNVS_LPLR).....	2749
44.9.10	SNVS_LP Control Register (SNVS_LPCR).....	2751
44.9.11	SNVS_LP Status Register (SNVS_LPSR).....	2754
44.9.12	SNVS_LP Secure Real Time Counter MSB Register (SNVS_LPSRTC MR).....	2756
44.9.13	SNVS_LP Secure Real Time Counter LSB Register (SNVS_LPSRTCLR).....	2756
44.9.14	SNVS_LP Time Alarm Register (SNVS_LPTAR).....	2757
44.9.15	SNVS_LP Secure Monotonic Counter MSB Register (SNVS_LPSMCMR).....	2757
44.9.16	SNVS_LP Secure Monotonic Counter LSB Register (SNVS_LPSMCLR).....	2758
44.9.17	SNVS_LP General Purpose Register (SNVS_LPGPR).....	2758
44.9.18	SNVS_HP Version ID Register 1 (SNVS_HPVIDR1).....	2759
44.9.19	SNVS_HP Version ID Register 2 (SNVS_HPVIDR2).....	2759

## Chapter 45

### Shared Peripheral Bus Arbiter (SPBA)

45.1	Overview.....	2761
45.1.1	Features.....	2762
45.1.2	Modes of operation.....	2763
45.2	Clocks.....	2763
45.3	Functional description.....	2764
45.3.1	Masters arbitration.....	2764
45.4	Resource ownership control.....	2767
45.4.1	Access control .....	2767
45.4.1.1	Peripheral access.....	2767
45.4.1.2	Peripheral Right Register access.....	2768
45.4.2	Owner election.....	2769
45.4.3	Ending ownership.....	2769
45.4.3.1	Software Controlled Ownership Ending.....	2769
45.4.4	The Un-owned State.....	2770

Section number	Title	Page
45.5	SPBA Memory Map/Register Definition.....	2770
45.5.1	Peripheral Rights Register (SPBA_PRR $n$ ).....	2772

## Chapter 46

### Sony/Philips Digital Interface (SPDIF)

46.1	Introduction .....	2775
46.1.1	Overview.....	2777
46.2	External Signals.....	2778
46.3	Clocks.....	2779
46.4	Functional Description.....	2779
46.4.1	SPDIF Receiver.....	2779
46.4.1.1	Audio Data Reception.....	2780
46.4.1.1.1	Application Note.....	2781
46.4.1.2	Channel Status Reception.....	2782
46.4.1.2.1	Channel Status Interrupt.....	2783
46.4.1.3	User Bit Reception.....	2783
46.4.1.4	Validity Flag Reception.....	2785
46.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	2785
46.4.1.6	Standards Compliance.....	2786
46.4.1.7	SPDIF PLOCK Detection and Rxclk Output.....	2787
46.4.1.8	Measuring Frequency of SPDIF_RxClk.....	2787
46.4.2	SPDIF Transmitter.....	2787
46.4.2.1	Audio Data Transmission.....	2788
46.4.2.2	Channel Status Transmission.....	2789
46.4.2.3	Validity Flag Transmission.....	2789
46.5	SPDIF Memory Map/Register Definition.....	2789
46.5.1	SPDIF Configuration Register (SPDIF_SCR).....	2791
46.5.2	CDText Control Register (SPDIF_SRCD).....	2793
46.5.3	PhaseConfig Register (SPDIF_SRPC).....	2794
46.5.4	InterruptEn Register (SPDIF_SIE).....	2795

Section number	Title	Page
46.5.5	InterruptStat Register (SPDIF_SIS).....	2797
46.5.6	InterruptClear Register (SPDIF_SIC).....	2799
46.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	2800
46.5.8	SPDIFRxRight Register (SPDIF_SRR).....	2801
46.5.9	SPDIFRxCChannel_h Register (SPDIF_SRC SH).....	2801
46.5.10	SPDIFRxCChannel_l Register (SPDIF_SRC SL).....	2802
46.5.11	UchannelRx Register (SPDIF_SR U).....	2802
46.5.12	QchannelRx Register (SPDIF_SR Q).....	2803
46.5.13	SPDIFTxLeft Register (SPDIF_ST L).....	2803
46.5.14	SPDIFTxRight Register (SPDIF_ST R).....	2804
46.5.15	SPDIFTxCChannelCons_h Register (SPDIF_ST C SCH).....	2804
46.5.16	SPDIFTxCChannelCons_l Register (SPDIF_ST C SCL).....	2805
46.5.17	FreqMeas Register (SPDIF_SRF M).....	2805
46.5.18	SPDIFTxCk Register (SPDIF_ST C).....	2806

## Chapter 47 System Reset Controller (SRC)

47.1	SRC Overview.....	2809
47.1.1	Features.....	2809
47.2	External Signals.....	2809
47.3	Clocks.....	2810
47.4	Top-level resets, power-up sequence and external supply integration.....	2811
47.4.1	Reset and Power-up Flow.....	2811
47.4.2	Finite-State Machine (FSM).....	2814
47.4.3	Power mode transitions.....	2815
47.5	Power-On Reset and power sequencing.....	2816
47.5.1	External POR using SRC_POR_B.....	2816
47.5.2	Internal POR.....	2817

Section number	Title	Page
47.6	Functional Description.....	2817
47.6.1	Reset Control.....	2817
47.6.1.1	Reset inputs and outputs.....	2817
47.6.1.2	Reset Handling.....	2819
47.6.1.2.1	Reset Qualification.....	2819
47.6.1.2.2	Reset Sequence and De-Assertion.....	2820
47.6.1.2.3	POR (SRC_POR_B).....	2820
47.6.1.2.4	COLD RESET.....	2821
47.6.1.2.5	WARM RESET.....	2822
47.6.2	Parallel Reset Requests.....	2823
47.6.3	Boot Mode Control.....	2824
47.6.3.1	BOOT_MODE Pin Latching.....	2824
47.7	SRC Memory Map/Register Definition.....	2825
47.7.1	SRC Control Register (SRC_SCR).....	2827
47.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	2830
47.7.3	SRC Reset Status Register (SRC_SRSR).....	2830
47.7.4	SRC Interrupt Status Register (SRC_SISR).....	2833
47.7.5	SRC Interrupt Mask Register (SRC_SIMR).....	2835
47.7.6	SRC Boot Mode Register 2 (SRC_SBMR2).....	2837
47.7.7	SRC General Purpose Register 1 (SRC_GPR1).....	2838
47.7.8	SRC General Purpose Register 2 (SRC_GPR2).....	2838
47.7.9	SRC General Purpose Register 3 (SRC_GPR3).....	2839
47.7.10	SRC General Purpose Register 4 (SRC_GPR4).....	2839
47.7.11	SRC General Purpose Register 5 (SRC_GPR5).....	2839
47.7.12	SRC General Purpose Register 6 (SRC_GPR6).....	2840
47.7.13	SRC General Purpose Register 7 (SRC_GPR7).....	2840
47.7.14	SRC General Purpose Register 8 (SRC_GPR8).....	2840
47.7.15	SRC General Purpose Register 9 (SRC_GPR9).....	2841
47.7.16	SRC General Purpose Register 10 (SRC_GPR10).....	2841

Section number	Title	Page
<b>Chapter 48</b>		
<b>Synchronous Serial Interface (SSI)</b>		
48.1	Overview.....	2843
48.1.1	Features.....	2844
48.1.2	Modes of Operation.....	2845
48.2	External Signal Description.....	2845
48.2.1	Signals Overview.....	2845
48.3	Clocks.....	2849
48.4	SSI Transmit FIFO 0 & 1 Registers.....	2849
48.5	SSI Transmit Shift Register (TXSR).....	2850
48.6	SSI Receive FIFO 0 and 1 Registers.....	2852
48.7	SSI Receive Shift Register (RXSR).....	2853
48.8	Functional Description.....	2855
48.8.1	Operating Modes.....	2855
48.8.1.1	Normal Mode.....	2857
48.8.1.1.1	Normal Mode Transmit.....	2857
48.8.1.1.2	Normal Mode Receive.....	2858
48.8.1.2	Network Mode.....	2860
48.8.1.2.1	Network Mode Transmit.....	2861
48.8.1.2.2	Network Mode Receive.....	2862
48.8.1.3	Gated Clock Mode.....	2864
48.8.1.4	I2S Mode.....	2867
48.8.1.5	AC97 Mode.....	2869
48.8.1.5.1	AC97 Fixed Mode (SSI.SACNT[1]=0).....	2871
48.8.1.5.2	AC97 Variable Mode (SSI.SACNT[1]=1).....	2871
48.8.2	External Frame and Clock Operation.....	2872
48.8.2.1	Data Alignment Formats Supported.....	2872
48.8.3	SSI Architecture.....	2873

Section number	Title	Page
48.8.4	SSI Clocking.....	2874
48.8.4.1	SSI Clock and Frame Sync Generation.....	2875
48.8.4.2	DIV2, PSR and PM Bit Description.....	2876
48.8.5	Receive Interrupt Enable Bit Description.....	2878
48.8.6	Transmit Interrupt Enable Bit Description.....	2879
48.8.7	Internal Frame and Clock Shutdown.....	2880
48.8.8	Peripheral Bus Interface.....	2882
48.8.8.1	Transfer Lengths Supported.....	2882
48.8.8.2	Transfer Bus Errors.....	2882
48.8.8.3	Clock Rate.....	2883
48.8.9	Reset.....	2883
48.9	SSI Memory Map/Register Definition.....	2883
48.9.1	SSI Transmit Data Register n (SSIx_STXn).....	2886
48.9.2	SSI Receive Data Register n (SSIx_SRXn).....	2886
48.9.3	SSI Control Register (SSIx_SCR).....	2887
48.9.4	SSI Interrupt Status Register (SSIx_SISR).....	2889
48.9.5	SSI Interrupt Enable Register (SSIx_SIER).....	2895
48.9.6	SSI Transmit Configuration Register (SSIx_STCR).....	2899
48.9.7	SSI Receive Configuration Register (SSIx_SRCR).....	2901
48.9.8	SSI Transmit Clock Control Register (SSIx_STCCR).....	2903
48.9.9	SSI Receive Clock Control Register (SSIx_SRCCR).....	2905
48.9.10	SSI FIFO Control/Status Register (SSIx_SFCSR).....	2906
48.9.11	SSI AC97 Control Register (SSIx_SACNT).....	2910
48.9.12	SSI AC97 Command Address Register (SSIx_SACADD).....	2911
48.9.13	SSI AC97 Command Data Register (SSIx_SACDAT).....	2911
48.9.14	SSI AC97 Tag Register (SSIx_SATAG).....	2912
48.9.15	SSI Transmit Time Slot Mask Register (SSIx_STMSK).....	2912
48.9.16	SSI Receive Time Slot Mask Register (SSIx_SRMSK).....	2913
48.9.17	SSI AC97 Channel Status Register (SSIx_SACCST).....	2913

Section number	Title	Page
48.9.18	SSI AC97 Channel Enable Register (SSLx_SACCEN).....	2914
48.9.19	SSI AC97 Channel Disable Register (SSLx_SACCDIS).....	2914

## Chapter 49 Temperature Monitor (TEMPMON)

49.1	Overview.....	2915
49.2	Software Usage Guidelines.....	2916
49.3	TEMPMON Memory Map/Register Definition.....	2917
49.3.1	Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0n).....	2918
49.3.2	Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1n).....	2920

## Chapter 50 TrustZone Address Space Controller (TZASC)

50.1	Overview.....	2921
50.2	Clocks.....	2922
50.3	i.MX 6SoloLite Specific Configuration .....	2922
50.4	Address Mapping in various memory mapping modes.....	2923

## Chapter 51 Universal Asynchronous Receiver/Transmitter (UART)

51.1	Overview.....	2925
51.1.1	Features.....	2926
51.1.2	Modes of Operation.....	2927
51.2	External Signals.....	2927
51.2.1	Detailed Signal Descriptions.....	2929
51.2.1.1	Serial/IrDA Signals.....	2929
51.2.1.1.1	RXD - Data Receive.....	2929
51.2.1.1.2	TXD - Data Transmit.....	2929
51.2.1.2	Modem Control Signals.....	2929
51.2.1.2.1	CTS - Clear To Send .....	2929
51.2.1.2.2	RTS - Request To Send.....	2929
51.2.1.2.3	DSR - Data Set Ready.....	2930
51.2.1.2.4	DCD - Data Carrier Detected.....	2930

Section number	Title	Page
51.2.1.2.5	DTR - Data Terminal Ready.....	2930
51.2.1.2.6	RI - Ring Indicator.....	2930
51.2.1.3	Interrupt Signals.....	2930
51.2.1.3.1	interrupt_uart - UART Interrupt.....	2930
51.2.1.4	DMA Request Signals.....	2930
51.2.1.4.1	dma_req_rx - Receiver DMA Request.....	2930
51.2.1.4.2	dma_req_tx - Transmitter DMA Request.....	2931
51.2.1.5	Special Signals.....	2931
51.2.1.5.1	stop_req - Stop Mode.....	2931
51.2.1.5.2	doze_req - Doze Mode.....	2931
51.2.1.5.3	debug_req - Debug Mode.....	2931
51.3	Clocks.....	2931
51.4	Functional Description.....	2932
51.4.1	Interrupts and DMA Requests.....	2932
51.4.2	Clocks.....	2933
51.4.2.1	Clock requirements.....	2933
51.4.2.2	Maximum Baud Rate.....	2934
51.4.2.3	Clocking in Low-Power Modes.....	2934
51.4.3	General UART Definitions.....	2935
51.4.3.1	RTS_B - UART Request To Send.....	2936
51.4.3.2	RTS Edge Triggered Interrupt.....	2936
51.4.3.3	DTR_B - Data Terminal Ready .....	2937
51.4.3.4	DSR_B - Data Set Ready.....	2937
51.4.3.5	DTR_B/DSR_B Edge Triggered Interrupt.....	2938
51.4.3.6	DCD_B - Data Carrier Detect.....	2938
51.4.3.7	RI_B - Ring Indicator.....	2939
51.4.3.8	CTS_B - Clear To Send.....	2939
51.4.3.9	Programmable CTS_B Deassertion.....	2939
51.4.3.10	TX_DATA - UART Transmit.....	2939

Section number	Title	Page
51.4.3.11	RX_DATA - UART Receive.....	2940
51.4.4	Transmitter.....	2942
51.4.4.1	Transmitter FIFO Empty Interrupt Suppression.....	2942
51.4.4.2	Transmitting a Break Condition.....	2944
51.4.5	Receiver.....	2944
51.4.5.1	Idle Line Detect.....	2945
51.4.5.2	Aging Character Detect.....	2946
51.4.5.3	Receiver Wake.....	2947
51.4.5.4	Receiving a BREAK Condition.....	2948
51.4.5.5	Vote Logic.....	2948
51.4.5.6	Baud Rate Automatic Detection Logic.....	2950
51.4.5.6.1	Baud Rate Automatic Detection Protocol.....	2951
51.4.5.6.2	New Baud Rate Determination.....	2951
51.4.5.6.2.1	New Autobaud Counter Stopped bit and Interrupt.....	2952
51.4.6	Escape Sequence Detection.....	2952
51.5	Binary Rate Multiplier (BRM).....	2954
51.6	Infrared Interface.....	2956
51.6.1	Generalities-Infrared.....	2956
51.6.2	Inverted Transmission and Reception bits (INVT & INVR).....	2957
51.6.3	InfraRed Special Case (IRSC) Bit.....	2957
51.6.4	IrDA interrupt.....	2958
51.6.5	Conclusion about IrDA.....	2959
51.6.6	Programming IrDA Interface.....	2960
51.6.6.1	High Speed.....	2960
51.6.6.2	Low Speed.....	2960
51.7	9-bit RS-485 Mode.....	2961
51.7.1	Generalities.....	2961
51.7.2	Transmit 9-bit RS-485 frames.....	2962

Section number	Title	Page
51.7.3	Receive 9-bit RS-485 frames.....	2962
51.7.3.1	RS-485 Slave Address Normal Detect Mode.....	2962
51.7.3.2	RS-485 Slave Address Automatic Detect Mode.....	2963
51.8	Low Power Modes.....	2963
51.8.1	UART Operation in System Doze Mode.....	2964
51.8.2	UART Operation in System Stop Mode.....	2964
51.8.3	Power Saving Method in UART.....	2965
51.9	UART Operation in System Debug State.....	2965
51.10	Reset.....	2966
51.10.1	Hardware reset.....	2966
51.10.2	Software reset.....	2966
51.11	Transfer Error.....	2966
51.12	Functional Timing.....	2967
51.12.1	IrDA Mode.....	2967
51.13	Initialization.....	2967
51.13.1	Programming the UART in RS-232 mode.....	2967
51.13.2	Programming the UART in 9-bit RS-485 mode.....	2969
51.14	References.....	2970
51.15	UART Memory Map/Register Definition.....	2971
51.15.1	UART Receiver Register (UARTx_URXD).....	2976
51.15.2	UART Transmitter Register (UARTx_UTXD).....	2978
51.15.3	UART Control Register 1 (UARTx_UCR1).....	2979
51.15.4	UART Control Register 2 (UARTx_UCR2).....	2981
51.15.5	UART Control Register 3 (UARTx_UCR3).....	2984
51.15.6	UART Control Register 4 (UARTx_UCR4).....	2986
51.15.7	UART FIFO Control Register (UARTx_UFCR).....	2988
51.15.8	UART Status Register 1 (UARTx_USR1).....	2990
51.15.9	UART Status Register 2 (UARTx_USR2).....	2993
51.15.10	UART Escape Character Register (UARTx_UESC).....	2995

Section number	Title	Page
51.15.11	UART Escape Timer Register (UARTx_UTIM).....	2996
51.15.12	UART BRM Incremental Register (UARTx_UBIR).....	2996
51.15.13	UART BRM Modulator Register (UARTx_UBMR).....	2997
51.15.14	UART Baud Rate Count Register (UARTx_UBRC).....	2997
51.15.15	UART One Millisecond Register (UARTx_ONEMS).....	2998
51.15.16	UART Test Register (UARTx_UTS).....	2999
51.15.17	UART RS-485 Mode Control Register (UARTx_UMCR).....	3000

## Chapter 52

### Universal Serial Bus Controller (USB)

52.1	Overview.....	3003
52.1.1	Features.....	3004
52.1.2	Modes of Operation.....	3005
52.1.2.1	Normal Mode.....	3006
52.1.2.2	Low-Power Mode.....	3006
52.2	External Signals.....	3007
52.3	Functional Description.....	3008
52.3.1	USB 2.0 Controller Core 0.....	3008
52.3.1.1	Host Mode.....	3008
52.3.1.2	Peripheral (Device) Mode.....	3008
52.3.1.3	Pins Used for OTG 1 Controller.....	3009
52.3.2	USB 2.0 Controller Core 1.....	3009
52.3.2.1	Pins Used for OTG 2 Controller.....	3009
52.3.3	USB 2.0 Controller Core 2.....	3010
52.3.4	USB Power Control.....	3010
52.3.4.1	Entering Low Power Suspend Mode.....	3010
52.3.4.2	Wake-Up Events.....	3011
52.3.4.2.1	Host Mode Events.....	3011
52.3.5	Interrupts.....	3012
52.3.5.1	USB Core Interrupts.....	3012

Section number	Title	Page
52.3.5.2	USB Wake-Up Interrupts.....	3012
52.4	USB Operation Model.....	3012
52.4.1	Register Interface.....	3013
52.4.1.1	Configuration, Control and Status Register Set.....	3013
52.4.1.2	Identification Registers.....	3015
52.4.1.3	OTG Operations.....	3016
52.4.1.3.1	Register Bits.....	3016
52.4.2	Host Data Structures.....	3017
52.4.2.1	Periodic Frame List.....	3018
52.4.2.2	Asynchronous List Queue Head Pointer.....	3019
52.4.2.3	Isochronous (High-Speed) Transfer Descriptor (iTDD).....	3020
52.4.2.3.1	Next Link Pointer.....	3021
52.4.2.3.2	iTDD Transaction Status and Control List.....	3022
52.4.2.3.3	iTDD Buffer Page Pointer List (Plus).....	3023
52.4.2.4	Split Transaction Isochronous Transfer Descriptor (siTDD).....	3025
52.4.2.4.1	Next Link Pointer.....	3025
52.4.2.4.2	siTDD Endpoint Capabilities/Characteristics.....	3026
52.4.2.4.3	siTDD Transfer State.....	3027
52.4.2.4.4	siTDD Buffer Pointer List (plus).....	3028
52.4.2.4.5	siTDD Back Link Pointer.....	3029
52.4.2.5	Queue Element Transfer Descriptor (qTDD).....	3029
52.4.2.5.1	Next qTDD Pointer.....	3030
52.4.2.5.2	Alternate Next qTDD Pointer.....	3031
52.4.2.5.3	qTDD Token.....	3031
52.4.2.5.4	qTDD Buffer Page Pointer List.....	3035
52.4.2.6	Queue Head.....	3035
52.4.2.6.1	Queue Head Horizontal Link Pointer.....	3036
52.4.2.6.2	Queue Head Endpoint Capabilities/Characteristics.....	3037
52.4.2.6.3	Transfer Overlay-Queue Head.....	3039

Section number	Title	Page
52.4.2.7	Periodic Frame Span Traversal Node (FSTN).....	3040
52.4.2.7.1	FSTN Normal Path Pointer .....	3041
52.4.2.7.2	FSTN Back Path Link Pointer .....	3041
52.4.3	Host Operational Model .....	3042
52.4.3.1	Host Controller Initialization .....	3042
52.4.3.2	Port Routing and Control .....	3043
52.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit .....	3045
52.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event .....	3046
52.4.3.2.3	Example Port Routing State Machine .....	3048
52.4.3.2.3.1	EHCI HC Owner .....	3048
52.4.3.2.3.2	Companion HC Owner .....	3049
52.4.3.2.4	Port Power .....	3049
52.4.3.2.5	Port Reporting Over-Current .....	3050
52.4.3.3	Suspend/Resume-Host Operational Model .....	3051
52.4.3.3.1	Port Suspend/Resume .....	3052
52.4.3.4	Schedule Traversal Rules .....	3054
52.4.3.4.1	Example - Preserving Micro-Frame Integrity .....	3056
52.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm .....	3057
52.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries .....	3059
52.4.3.6	Periodic Schedule .....	3062
52.4.3.7	Managing Isochronous Transfers Using iTDs .....	3063
52.4.3.7.1	Host Controller Operational Model for iTDs .....	3064
52.4.3.7.2	Software Operational Model for iTDs .....	3066
52.4.3.7.2.1	Periodic scheduling threshold.....	3068
52.4.3.8	Asynchronous Schedule .....	3069
52.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	3070
52.4.3.8.2	Removing Queue Heads from Asynchronous Schedule .....	3071
52.4.3.8.3	Empty Asynchronous Schedule Detection .....	3073

Section number	Title	Page
52.4.3.8.4	Restarting Asynchronous Schedule Before EOF .....	3074
52.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal .....	3075
52.4.3.8.4.2	Async Sched Not Active .....	3076
52.4.3.8.4.3	Async Sched Active .....	3076
52.4.3.8.4.4	Async Sched Sleeping .....	3077
52.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	3077
52.4.3.8.5	Asynchronous schedule traversal: Start Event.....	3077
52.4.3.8.6	Reclamation Status Bit (USBSTS Register) .....	3078
52.4.3.9	Operational Model for Nak Counter.....	3078
52.4.3.9.1	Nak Count Reload Control .....	3080
52.4.3.9.1.1	Wait for List Head .....	3081

## Chapter 53

### Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

53.1	USB PHY Overview.....	3267
53.2	Operation.....	3268
53.2.1	UTMI.....	3269
53.2.2	Digital Transmitter.....	3269
53.2.3	Digital Receiver.....	3269

Section number	Title	Page
53.2.4	Analog Receiver.....	3269
53.2.4.1	HS Differential Receiver.....	3270
53.2.4.2	Squelch Detector.....	3271
53.2.4.3	LS/FS Differential Receiver.....	3271
53.2.4.4	HS Disconnect Detector.....	3271
53.2.4.5	USB Plugged-In Detector.....	3271
53.2.4.6	Single-Ended USB_DP Receiver.....	3272
53.2.4.7	Single-Ended USB_DN Receiver.....	3272
53.2.4.8	9X Oversample Module.....	3272
53.2.5	Analog Transmitter.....	3272
53.2.5.1	Switchable High-Speed 45Ω Termination Resistors.....	3272
53.2.5.2	Low-Speed/Full-Speed Differential Driver.....	3273
53.2.5.3	High-Speed Differential Driver.....	3273
53.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	3273
53.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	3273
53.2.6	Recommended Register Configuration for USB Certification.....	3275
53.2.7	Charger detection.....	3275
53.2.7.1	Charger detect control table.....	3275
53.2.7.2	Data pin contact detector.....	3275
53.2.7.3	Charger detector.....	3276
53.2.7.4	Charger detection software flow.....	3276
53.2.7.5	Dead Battery Protect.....	3278
53.3	USB PHY Memory Map/Register Definition.....	3278
53.3.1	USB PHY Power-Down Register (USBPHY <sub>x</sub> _PWD <sub>n</sub> ).....	3281
53.3.2	USB PHY Transmitter Control Register (USBPHY <sub>x</sub> _TX <sub>n</sub> ).....	3283
53.3.3	USB PHY Receiver Control Register (USBPHY <sub>x</sub> _RX <sub>n</sub> ).....	3284
53.3.4	USB PHY General Control Register (USBPHY <sub>x</sub> _CTRL <sub>n</sub> ).....	3286
53.3.5	USB PHY Status Register (USBPHY <sub>x</sub> _STATUS).....	3289
53.3.6	USB PHY Debug Register (USBPHY <sub>x</sub> _DEBUG <sub>n</sub> ).....	3291

Section number	Title	Page
53.3.7	UTMI Debug Status Register 0 (USBPHY <sub>x</sub> _DEBUG0_STATUS).....	3293
53.3.8	UTMI Debug Status Register 1 (USBPHY <sub>x</sub> _DEBUG1n).....	3294
53.3.9	UTMI RTL Version (USBPHY <sub>x</sub> _VERSION).....	3295
53.4	USB Analog Memory Map/Register Definition.....	3295
53.4.1	USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECTn).....	3297
53.4.2	USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECTn).....	3298
53.4.3	USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT).....	3300
53.4.4	USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT).....	3302
53.4.5	USB Misc Register (USB_ANALOG_USB1_MISCN).....	3303
53.4.6	USB VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECTn).....	3304
53.4.7	USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECTn).....	3306
53.4.8	USB VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT).....	3308
53.4.9	USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT).....	3310
53.4.10	USB Misc Register (USB_ANALOG_USB2_MISCN).....	3311
53.4.11	Chip Silicon Version (USB_ANALOG_DIGPROG).....	3312

## Chapter 54

### Ultra Secured Digital Host Controller (uSDHC)

54.1	Overview.....	3313
54.1.1	Features.....	3316
54.1.2	Modes and Operations.....	3317
54.1.2.1	Data transfer Modes.....	3317
54.2	External Signals.....	3317
54.2.1	Signals Overview.....	3322
54.3	Clocks.....	3323
54.4	Functional Description.....	3323
54.4.1	Data Buffer.....	3324
54.4.1.1	Write Operation Sequence.....	3326
54.4.1.2	Read Operation Sequence.....	3327
54.4.1.3	Data Buffer and Block Size.....	3327

Section number	Title	Page
54.4.1.4	Dividing Large Data Transfer.....	3328
54.4.1.5	External DMA Request.....	3329
54.4.2	DMA AHB Interface.....	3330
54.4.2.1	Internal DMA Request.....	3331
54.4.2.2	DMA Burst Length.....	3332
54.4.2.3	AHB Master Interface.....	3332
54.4.2.4	ADMA Engine.....	3332
54.4.2.4.1	ADMA Concept and Descriptor Format.....	3333
54.4.2.4.2	ADMA Interrupt.....	3334
54.4.2.4.3	ADMA Error.....	3335
54.4.3	Register Bank with IP Bus Interface.....	3335
54.4.3.1	SD Protocol Unit.....	3336
54.4.3.2	SD control misc.....	3337
54.4.3.3	SD Clock control.....	3337
54.4.3.4	Command control.....	3337
54.4.3.5	Data control.....	3338
54.4.4	Clock & Reset Manager.....	3338
54.4.5	Clock Generator.....	3339
54.4.6	SDIO Card Interrupt.....	3339
54.4.6.1	Interrupts in 1-bit Mode.....	3339
54.4.6.2	Interrupt in 4-bit Mode.....	3339
54.4.6.3	Card Interrupt Handling.....	3340
54.4.7	Card Insertion and Removal Detection.....	3341
54.4.8	Power Management and Wake Up Events.....	3342
54.4.8.1	Setting Wake Up Events.....	3343
54.4.9	MMC fast boot.....	3343
54.4.9.1	Boot operation.....	3343
54.4.9.2	Alternative boot operation.....	3344

Section number	Title	Page
54.5	Initialization/Application of uSDHC.....	3345
54.5.1	Command Send & Response Receive Basic Operation.....	3345
54.5.2	Card Identification Mode.....	3346
54.5.2.1	Card Detect.....	3346
54.5.2.2	Reset.....	3347
54.5.2.3	Voltage Validation.....	3348
54.5.2.4	Card Registry.....	3350
54.5.3	Card Access.....	3351
54.5.3.1	Block Write.....	3351
54.5.3.1.1	Normal Write.....	3351
54.5.3.1.2	DDR Write.....	3353
54.5.3.1.3	Write with Pause.....	3353
54.5.3.2	Block Read.....	3355
54.5.3.2.1	Normal Read.....	3355
54.5.3.2.2	DDR Read.....	3355
54.5.3.2.3	Read with Pause.....	3356
54.5.3.2.4	DLL (Delay Line) in Read Path.....	3357
54.5.3.3	Suspend Resume.....	3359
54.5.3.3.1	Suspend.....	3359
54.5.3.3.2	Resume.....	3360
54.5.3.4	ADMA Usage.....	3360
54.5.3.5	Transfer Error.....	3361
54.5.3.5.1	CRC Error.....	3361
54.5.3.5.2	Internal DMA Error.....	3361
54.5.3.5.3	Transfer ADMA Error.....	3362
54.5.3.5.4	Auto CMD12 Error.....	3362
54.5.3.6	Card Interrupt.....	3363
54.5.4	Switch Function.....	3363
54.5.4.1	Query, Enable and Disable SDIO High Speed Mode.....	3364

Section number	Title	Page
54.5.4.2	Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50.....	3364
54.5.4.3	Query, Enable and Disable MMC High Speed Mode.....	3365

# Chapter 1

## Introduction

### 1.1 About This Document

The i.MX 6SoloLite application processors are Freescale Semiconductor's latest additions to a growing family of multimedia-focused products offering high performance processing optimized for lowest power consumption.

The i.MX 6SoloLite processors feature Freescale's advanced implementation of the ARM<sup>®</sup>Cortex<sup>®</sup>-A9 core, which can be interfaced with DDR3-800, LV-DDR3-800 and LPDDR2-800 DRAM memory devices.

These products are suitable for applications such as:

- eReaders
- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- Portable navigation devices
- Gaming Consoles

#### 1.1.1 Audience

This manual is intended to be used by board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands concepts of digital system design, microprocessor architecture, Input / Output (I/O) devices, industry standard communication and device interface protocols.

## 1.1.2 Organization

This document covers the i.MX 6SoloLite at a system level and provides an architectural overview. Also covered are system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

## 1.1.3 Suggested Reading

This section lists additional reading materials that provide background for the information in this manual, as well as general information about the architecture.

### 1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex-A9 processor.

For information about the ARM Cortex-A9 processor see:

- <http://infocenter.arm.com>

### 1.1.3.2 Related Documentation

Freescale documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.freescale.com>.

## 1.1.4 Conventions

This document uses the following notational conventions:

#### **cleared / set**

When a bit takes the value zero, it is said to be cleared; when it takes a value of one, it is said to be set.

#### **mnemonics**

Instruction mnemonics are shown in lowercase bold

#### *italics*

Italics indicate variable command parameters, for example, **bcctrx**

Book titles in text are set in italics

15

An integer in decimal

0x

Prefix to denote hexadecimal number

0b

Prefix to denote binary number. Binary 0 and 1 are written without the prefix.

n'H4000CA00

n-bit Hexadecimal number

BLK\_REG\_NAME

Register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (\_).

BLK\_REG[FIELD]

Fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK\_REG[ *n*]

Bit number *n* within register BLK.REG.

BLK\_REG[ *l:r*]

Register bit ranges. Ranges are indicated by the left-most bit number *l* and the right-most bit number *r* separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

x, U

In some contexts, such as signal encodings, an unitalicized x indicates a don't care or uninitialized. The binary value could be 1 or 0.

*x*

An italicized *x* indicates an alphanumeric variable

*n, m*

Italicized *n* or *m* represent integer variables

!

Binary logic operator NOT

&amp;&amp;

Binary logic operator AND

||

Binary logic operator OR

^ or &lt;O+&gt;

Binary logic operator XOR

|

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value 0b1001.

&amp;

Bit-wise AND. For example, 0b0001 & 0b1000 yields the value 0b0000.

{A,B}

Concatenation, where the  $n$ -bit value  $A$  is prepended to the  $m$ -bit value  $B$  to form an  $(n+m)$ -bit value. For example,  $\{0, \text{REG}_m[14:0]\}$  yields a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in an register. Although these bits can be written to as ones or zeros, they are always read as zeros.

>>

Shift right logical one position

<<

Shift left logical one position

= <left arrow>

Assignment

==

Compare equal

!=

Compare not equal

>

Greater than

<

Less than

## 1.1.5 Register Access

### 1.1.5.1 Register Diagram Field Access Type Legend

The following figure provides the interpretation of the notation used in register diagrams for a number of common field access types.

Figure 1-1. Register Field Conventions

#### NOTE

For reserved register fields, software should mask off the data in the field after read (software can not rely on the contents of data read from a reserved field) and always write all zeros.

### 1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all bits set to 1 perform the associated operation on the primary register, while all bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read/modify/write operations. When atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

### 1.1.6 Signal Conventions

**\_b, \_B**

When appended to a signal name, indicates that a signal is active-low

**NEG\_ACTIVE**

Overbar also denotes a negative active signal

**UPPERCASE**

Package pin names, Block I/O signals

**lowercase**

Lowercase is used to indicate internal signals

## 1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
AHB	Advanced High-performance Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
AXI	Advanced eXtensible Interface
BIST	Built-in self test
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
EPD	Electrophoretic Display
EPDC	Electrophoretic Display Controller
EPROM	Erasable programmable read-only memory
FIFO	First-in-first-out
GPIO	General-purpose I/O
GPR	General-purpose register
GPS	Global Positioning System
GPU	Graphics Processing Unit
HAB	High Assurance Boot
I2C or I <sup>2</sup> C	Inter-integrated circuit
IEEE	Institute of Electrical and Electronics Engineers
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LCDIF	Liquid Crystal Display Interface
LDO	Low-Dropout
LIFO	Last-in-first-out
LRU	Least recently used
LSB	Least-significant byte
LUT	Lookup Table

*Table continues on the next page...*

Term	Meaning
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	MultiMedia Card
MSB	Most-significant byte
MT/s	Mega transfers per second
OCRAM	On-Chip Random Access Memory
PCI	Peripheral Component Interconnect
PCle	PCI enhanced
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable interrupt controller
POR	Power-on reset
PSRAM	Pseudo-Static Random Access Memory
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced instruction set computing
ROM	Read-Only Memory
RTOS	Real-time operating system
Rx	Receive
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous data link control
SDMA	Smart DMA
SoC	System-On-Chip
SPDC	SiPix Display Controller
SPDIF	Sony Phillips Digital Interface
SPI	Serial peripheral interface
SRAM	Static random access memory
TFT	Thin Film Transistor
Tx	Transmit
UART	Universal asynchronous receiver/transmitter
USB	Universal serial bus
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

## 1.2 Introduction

This chapter introduces the architecture of the i.MX 6SoloLite Multimedia Applications Processor.

The i.MX 6SoloLite processor represents Freescale Semiconductor's latest achievement in integrated multimedia applications processors.

It is part of a growing family of multimedia-focused products, offering high performance processing optimized for the lowest power consumption.

## 1.3 Target Applications

The i.MX 6SoloLite applications processor is designed specifically for the eReader market. This device integrates the unique display controller for EPD panel, pixel processing engines, and graphics engines to make it an ideal solution for EPD-based eReaders. This device also has an integrated LCD controller that allows it to support eReaders with LCD panels.

The architecture's flexibility also allows for use in a wide variety of general embedded applications. The heart of the application chipset, the i.MX 6SoloLite processor provides all of the interfaces necessary for connecting peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

## 1.4 Features

The i.MX 6SoloLite processors are based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

- Single ARM Cortex-A9 MPCore (with TrustZone) with:
  - 32 KB L1 Instruction Cache
  - 32 KB L1 Data Cache
  - Private Timer and Watchdog
  - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 256 KB unified I/D L2 cache:
- Two Master AXI (32-bit) bus interfaces output of L2 cache
- NEON MPE coprocessor

- SIMD Media Processing Architecture
- NEON register file with 32x64-bit general-purpose registers
- NEON Integer execute pipeline (ALU, Shift, MAC)
- NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
- NEON load/store and permute pipeline
- Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
- Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

Target frequency of the core (including Neon and L1 cache) is 800 MHz non-overdrive over the specified temperature range:

- 1 GHz overdrive over the specified temperature range
- 800 MHz non-overdrive over the specified temperature range

The i.MX 6SoloLite processors support latest, high volume, cost effective handheld DRAM, NOR Flash, and SD memory card standards.

The memory system consists of the following components:

- Level 1 Cache—32 KB Instruction, 32 KB Data cache per core
- Level 2 Cache—Unified instruction and data (256 KB)
- On-Chip Memory:
  - Boot ROM, including High Assurance Boot (HAB, 96 KB)
  - Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- External memory interfaces:
  - 16/32-bit LP-DDR2, 16/32-bit DDR3-800, and LV-DDR3-800
  - 16-bit NOR Flash
  - 16-bit PSRAM, Cellular RAM

Each i.MX 6SoloLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

Displays:

- EPDC supporting color and monochrome E-INK EPD panels up to 1650x2332 resolution and 5-bit grayscale
- SPDC supporting monochrome SiPix EPD panels up to 1600x1200 resolution
- LCDIF supporting one parallel 24-bit LCD display with up to WXGA(1366x768) resolution at 60 Hz
- Both LCD and a single EPD displays can be active simultaneously. This limitation exists because both EPD controllers are multiplexed over the same set of pins.

Camera sensors:

- Parallel Camera port (up to 16 bit and up to 66 MHz peak)

Expansion cards: Four MMC/SD/SDIO card ports all supporting:

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)

USB:

- Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
- One High Speed (HS) USB 2.0 host with integrated HS-IC USB (High Speed Inter-Chip USB) Phy

Miscellaneous IPs and interfaces:

- Three I2S/SSI/AC97, up to 1.4 Mbps each
- Five UARTs operating up to 4.0 Mbps each, providing RS232 interface and supporting 9-bit RS485 multidrop mode. One UART supports 8-wire mode while the remaining four support 4-wire only.
- Four eCSPI (Enhanced CSPI), three of them can support up to 52 Mbps, one can be of low speed
- Three I2C, supporting 400 kbps
- Fast Ethernet Controller, 10/100 Mbps
- Four Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)

The i.MX 6SoloLite processors integrate advanced power management unit and controllers:

- Provide PMU, including multiple LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6SoloLite processors use dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6SoloLite processors incorporate the following hardware accelerators:

- GPU2Dv2—2D Graphics Processing Unit (BitBlt)
- GPUVG—OpenVG 1.1 Graphics Processing Unit
- PXP—PiXeL Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- DCP—Data Co-Processor for cryptographic function, with 128-bit AES for Bulk Encryption, ECB and CCB modes, supports SHA-1, SHA-256 for Message Authentication/Integrity.
- RNGB—True Random Number Generation.
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock.
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- HAB—High Assurance Boot (Secure Boot) v4.1.

### NOTE

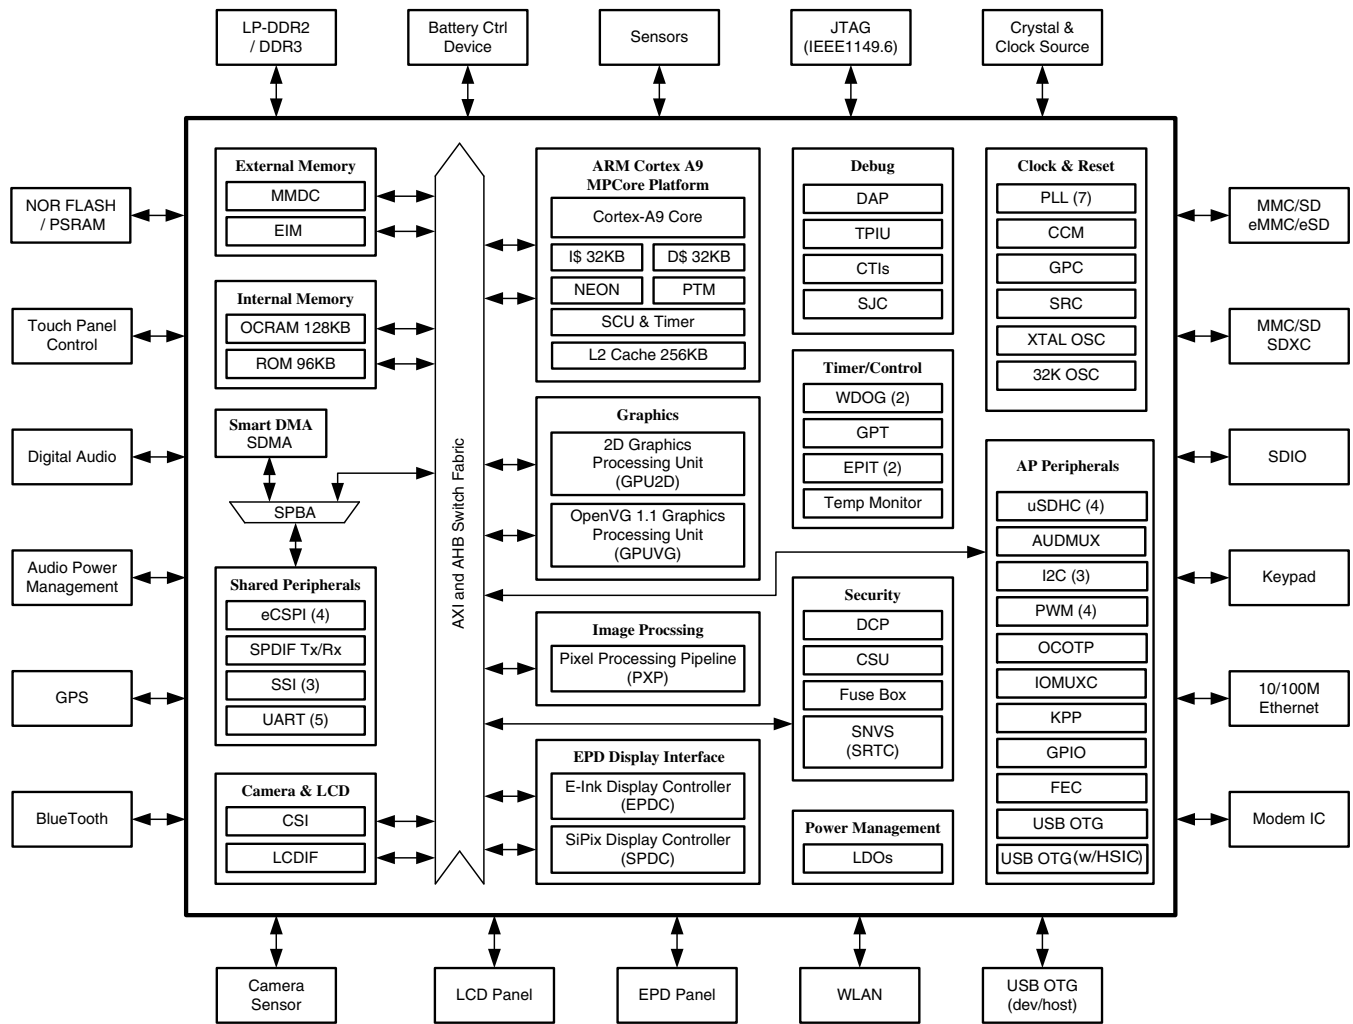

The actual feature set depends on the part number. Functions, such as 2D and OpenVG hardware graphics acceleration may not be enabled for specific part numbers.

## 1.5 Architectural Overview

This section contains i.MX 6SoloLite architectural details.

### 1.5.1 Simplified Block Diagram

A high level block diagram is shown in the figure below. This diagram provides a view of the i.MX 6SoloLite major sub-systems (processor domains, shared peripherals domain, memories, and so on) and logical connectivity.

**Figure 1-2. Simplified Block Diagram**

## 1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ Platform is responsible for:
  - Operating System
  - User applications (including control over hardware accelerators and non-accelerated functions)
  - TrustZone applications
  - 256KB L2 Cache memory inside ARM platform can be configured into OCRAM mode and used as normal OCRAM
- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:

- Clock Control Module (CCM)
- Seven PLLs
- XTALOSC- 24MHz Crystal oscillator source support
- OSC32KHz - 32.768Hz Crystal oscillator source support
- System Reset Controller (SRC)
- General Power Controller (GPC)
- Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
  - Graphics Processing Unit (GPU2Dv2)
    - Full function programmable 2D pipeline
    - Supports multiple 1080p surfaces
    - Programmable 9x9 tap filter
    - Range of image formats video and image manipulation
  - Vector graphics processing unit (GPUVGv2):
    - OpenVG 1.1 support
    - Full fixed function hardware vector graphics GPU
    - Hardware Tessellation (Minimum CPU involvement)
    - 16x FSAA, Photorealistic quality, No performance degradation
    - Multi-format rendering, including sRGB color transformation and video image conversion — High-quality vector font rendering support
    - Dedicated GPU for QoS requirements
  - Audio
    - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
    - 3x SSIs interfaced to Audio Mux
    - SPDIF Tx/Rx
  - Video
    - Video codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MPEG4 and H.264.
- Security is supported by:
  - High Assurance Boot (HAB4) System
  - ARM TrustZone (TZ) Trusted Execution environment
  - DDR Memory secure region protection by TrustZone Address Space Controller
  - On-chip RAM (OCRAM) single region TrustZone protection
  - Peripheral access policy control, using Central Security Unit (CSU)
  - One-Time Programmable (OTP) electrical fuse array (Total of 2048-bit e-fuses) via the On-chip electrical fuse controller (OCOTP\_CTRL)
  - DCP and SNVS security architecture, providing:
    - Secure Real Time Counters (SRTC)
    - Security State Controller

- Random Number Generator (RNGB)
- Security Violation/Tamper Detection & Reporting
- System JTAG controller (SJC)
- TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
  - Embedded DMAs
  - Configurable 1.8V/3.3V IO voltage for seamless integration
  - Three USB 2.0 ports, including PHYs: 2x HS-USB OTG and 1x HS-IC USB HOST integrated PHYs
  - DDR2 Memory: 800 Mbps/line
  - LP-DDR2/DDR3/LVDDR3 (32-bit or 16-bit)
  - Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
  - Miscellaneous connectivity support -MMC/SD, I2C, SPI, UART, PWM and Keypad interface

### 1.5.3 Endianness Support

i.MX 6SoloLite supports Little Endian mode only.

### 1.5.4 Memory Interfaces

i.MX 6SoloLite supports the following memory interfaces:

- LP-DDR2, 32-bit, 400MHz clock
- DDR3 / LV-DDR3 32-bit, 400MHz clock.

NOR Flash, SRAM and PSRAM, 16/8-bit NOR Flash, interface is supported by the EIM block. All EIM pins are muxed on other interfaces.

## Chapter 2

# Memory Maps

## 2.1 Memory system overview

This chapter introduces the memory architecture of the i.MX 6SoloLite device.

## 2.2 ARM platform memory map

The i.MX 6SoloLite memory map has been provided in the following tables. The mapping of the DDR memory address space can be configured by software or hardware fuses, depending on the memory device type (LPDDR2/DDR2/DDR3) and the selected interleave/non-interleaving scheme.

**Table 2-1. System memory map**

Start address	End address	Size	Description
8000_0000	FFFF_FFFF	2048 MB	MMDC - DDR Controller.
1000_0000	7FFF_FFFF	1792 MB	Reserved
0800_0000	0FFF_FFFF	128 MB	EIM - Memory
02C0_0000	07FF_FFFF	84 MB	Reserved
02A0_0000	02DF_FFFF	4 MB	Reserved
0260_0000	029F_FFFF	4 MB	
0220_C000	023F_FFFF	2 MB	Reserved
0220_8000	0220_BFFF	16 KB	Reserved
0220_4000	0220_7FFF	16 KB	OpenVG (GC355)

**NOTE**

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

## 2.3 DMA memory map

The Smart DMA memory map can be found in the following table.

**Table 2-5. SDMA peripheral memory map**

Peripheral	Base address	Size
Reserved for SDMA internal memory	0x0000	4KB
SPDIF	0x1000	4KB

*Table continues on the next page...*

**Table 2-5. SDMA peripheral memory map (continued)**

Peripheral	Base address	Size
eCSPI-1	0x2000	4KB
eCSPI-2	0x3000	4KB
eCSPI-3	0x4000	4KB
eCSPI-4	0x5000	4KB
UART-5	0x6000	4KB
Reserved for SDMA internal registers	0x7000	4KB
UART-1	0x8000	4KB
UART-2	0x9000	4KB
SSI-1	0xA000	4KB
SSI-2	0xB000	4KB
SSI-3	0xC000	4KB
UART-3	0xD000	4KB
UART-4	0xE000	4KB
SPBA Registers	0xF000	4KB

**NOTE**

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

## Chapter 3

# Interrupts and DMA Events

### 3.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in [AP interrupts](#) and from DMA events in [SDMA event mapping](#)

#### 3.1.1 AP interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all i.MX 6SoloLite sources and provides an interface to each of the CPU cores.

The first 32 interrupts are used for interrupts that are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the private CPU are also hooked up to the GPC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the ARM interrupt sources.

**Table 3-1. ARM domain interrupt summary**

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General Purpose Register 1 from IOMUXC. Used to notify core on exception condition while boot.
33	DAP	Debug Access Port interrupt request.
34	SDMA	SDMA interrupt request from all channels.
35	-	Reserved
36	SNVS	PMIC power off request.
37	RNGB	Random Number Generator interrupt request.
38	SPDC	SiPix Display Controller interrupt request.
39	CSI	CMOS Sensor Interface interrupt request

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
40	Reserved	Reserved
41	Reserved	Reserved
42	R2D GPU2D	R2D GPU2D general interrupt request.
43	V2D GPU2D	V2D GPU2D(OpenVG) general interrupt request.
44	Reserved	Reserved
45	Reserved	Reserved
46	EIM	EIM interrupt request.
47	Reserved	Reserved
48	Reserved	Reserved
49	Reserved	Reserved
50	Reserved	Reserved
51	SNVS	SNVS consolidated interrupt.
52	SNVS	SNVS security interrupt.
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request.
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request.
56	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request.
57	uSDHC4	uSDHC4 (Enhanced SDHC) interrupt request.
58	UART1	UART1 interrupt request.
59	UART2	UART2 interrupt request.
60	UART3	UART3 interrupt request.
61	UART4	UART4 interrupt request.
62	UART5	UART5 interrupt request.
63	eCSPI1	eCSPI1 interrupt request.
64	eCSPI2	eCSPI2 interrupt request.
65	eCSPI3	eCSPI3 interrupt request.
66	eCSPI4	eCSPI4 interrupt request.
67	Reserved	Reserved
68	I2C1	I2C1 interrupt request.
69	I2C2	I2C2 interrupt request.
70	I2C3	I2C3 interrupt request.
71	LCDIF	LCDIF interrupt request.
72	USB	USB OTG2 interrupt request.
73	Reserved	Reserved
74	USB	USB Host interrupt request.
75	USB	USB OTG 1 interrupt request.
76	USB_PHY	UTMI0 interrupt request.
77	USB_PHY	UTMI1 interrupt request.

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
78	SSI1	SSI1 interrupt request.
79	SSI2	SSI2 interrupt request.
80	SSI3	SSI3 interrupt request.
81	Temperature Monitor	Temperature Sensor (temp. greater than threshold) interrupt request.
82	Reserved	Reserved
83	Reserved	Reserved
84	SPDIF	SPDIF interrupt.
85	Reserved	Reserved
86	PMU	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
87	GPT	Logical OR of GPT rollover interrupt line, input capture 1 & 2 lines, output compare 1, 2 & 3 interrupt lines.
88	EPIT1	EPIT1 output compare interrupt.
89	EPIT2	EPIT2 output compare interrupt.
90	GPIO1	INT7 interrupt request.
91	GPIO1	INT6 interrupt request.
92	GPIO1	INT5 interrupt request.
93	GPIO1	INT4 interrupt request.
94	GPIO1	INT3 interrupt request.
95	GPIO1	INT2 interrupt request.
96	GPIO1	INT1 interrupt request.
97	GPIO1	INT0 interrupt request.
98	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15.
99	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31.
100	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15.
101	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31.
102	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15.
103	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31.
104	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15.
105	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31.
106	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15.
107	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31.
108	Reserved	Reserved
109	Reserved	Reserved
110	Reserved	Reserved
111	Reserved	Reserved
112	WDOG1	WDOG1 timer reset interrupt request.
113	WDOG2	WDOG2 timer reset interrupt request.
114	KPP	Key Pad interrupt request.

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
115	PWM1	Cumulative interrupt line for PWM1. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
116	PWM2	Cumulative interrupt line for PWM2. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
117	PWM3	Cumulative interrupt line for PWM3. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
118	PWM4	Cumulative interrupt line for PWM4. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
119	CCM	CCM interrupt request 1.
120	CCM	CCM interrupt request 2.
121	GPC	GPC interrupt request 1.
122	Reserved	Reserved
123	SRC	SRC interrupt request.
124	CPU	L2 interrupt request.
125	CPU	Parity Check error interrupt request.
126	CPU	Performance Unit interrupt.
127	CPU	CTI trigger outputs interrupt.
128	SRC	CPU wdog interrupt out of SRC.
129	EPDC	EPDC interrupt request.
130	PXP	PXP interrupt request.
131	DCP	DCP general interrupt request.
132	DCP	DCP channel 0 interrupt request.
133	DCP	DCP secure interrupt request.
134	Reserved	Reserved
135	Reserved	Reserved
136	SJC	SJC interrupt from General Purpose register.
137	Reserved	Reserved
138	Reserved	Reserved
139	Reserved	Reserved
140	ASC1	ASC1 interrupt request.
141	Reserved	Reserved
142	Reserved	Reserved
143	Reserved	Reserved
144	Reserved	Reserved
145	Reserved	Reserved
146	FEC	Fast Ethernet Controller interrupt request.
147	Reserved	Reserved

158	Reserved	Reserved
159	PMU	Brown-out event on core, gpu or soc regulators.

## 3.2 SDMA event mapping

The following table shows the DMA request signals for peripherals in i.MX 6SoloLite.

**Table 3-2. SDMA event mapping**

Event Number	DMA Source	Description
0	Reserved	Reserved
1	Reserved	Reserved
2	Reserved	Reserved
3	eCSPI1 / I2C3	eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[1].
4	eCSPI1 / I2C2	eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[2].
5	eCSPI2 / I2C1	eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[3].
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3	eCSPI3 Rx request
8	eCSPI3	eCSPI3 Tx request
9	eCSPI4 / EPIT2	eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[5].
10	eCSPI4 / I2C1	eCSPI4 Tx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4].
11	Reserved	Reserved
12	Reserved	Reserved
13	GPT	GPT counter event
14	SPDIF / IOMUX	SPDIFRX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[7].
15	SPDIF	SPDIF TX DMA request
16	EPIT1	EPIT1 request.

*Table continues on the next page...*

**Table 3-2. SDMA event mapping (continued)**

Event Number	DMA Source	Description
17	Reserved	Reserved
18	Reserved	Reserved
19	Reserved	Reserved
20	Reserved	Reserved
21	Reserved	Reserved
22	Reserved	Reserved
23	I2C3	I2C3 DMA request
24	Reserved	Reserved
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3	UART3 Rx FIFO
30	UART3	UART3 Tx FIFO
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5	UART5 Rx FIFO
34	UART5	UART5 Tx FIFO
35	SSI1	SSI1 receive 1 DMA request
36	SSI1	SSI1 transmit 1 DMA request
37	SSI1	SSI1 receive 0 DMA request

45	SSI3	SSI3 receive 0 DMA request
46	SSI3	SSI3 transmit 0 DMA request
47	Reserved	Reserved

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

# Chapter 4

## External Signals and Pin Multiplexing

### 4.1 Overview

The i.MX 6SoloLite contains a limited number of pins, most of which have multiple signal options. These signal to pin and pin to signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

[Pin Assignments](#) lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. [Muxing Options](#) lists the external signals grouped by module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

#### 4.1.1 Pin Assignments

Table 4-1. Pin Assignments

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
AUD_MCLK	ALT0	AUDIO_CLK_OUT	LVE - DISABLED	SW_PAD_CTL_PAD_AUD_MCLK
	ALT1	PWM4_OUT	HYS - ENABLED	
	ALT2	ECSPI3_RDY	PUS - 100K_OHM_PD	
	ALT3	FEC_MDC	PUE - KEEP	
	ALT4	WDOG2_RESET_B_DEB	PKE - ENABLED	
	ALT5	GPIO1_IO06	ODE - DISABLED	
	ALT6	SPDIF_EXT_CLK	SPEED - 100MHZ	
			DSE - 40_OHM	
			SRE - SLOW	

Table continues on the next page...

**Table 4-1. Pin Assignments (continued)**

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
AUD_RXC	ALT0	AUD3_RXC	LVE - DISABLED	SW_PAD_CTL_PAD_AUD_RXC
	ALT1	I2C1_SDA	HYS - ENABLED	
	ALT2	UART3_TX_DATA	PUS - 100K_OHM_PD	
	ALT3	FEC_TX_CLK	PUE - KEEP	
	ALT4	I2C3_SDA	PKE - ENABLED	
	ALT5	GPIO1_IO01	ODE - DISABLED	
	ALT6	ECSPI3_SS1	SPEED - 100MHZ DSE - 40_OHM SRE - SLOW	
AUD_RXD	ALT0	AUD3_RXD	LVE - DISABLED	SW_PAD_CTL_PAD_AUD_RXD
	ALT1	ECSPI3_MOSI	HYS - ENABLED	
	ALT2	UART4_RX_DATA	PUS - 100K_OHM_PD	
	ALT3	FEC_RX_ER	PUE - KEEP	
	ALT4	SD1_LCTL	PKE - ENABLED	
	ALT5	GPIO1_IO02	ODE - DISABLED SPEED - 100MHZ DSE - 40_OHM SRE - SLOW	
AUD_RXFS	ALT0	AUD3_RXFS	LVE - DISABLED	SW_PAD_CTL_PAD_AUD_RXFS
	ALT1	I2C1_SCL	HYS - ENABLED	
	ALT2	UART3_RX_DATA	PUS - 100K_OHM_PD	
	ALT3	FEC_MDIO	PUE - KEEP	
	ALT4	I2C3_SCL	PKE - ENABLED	
	ALT5	GPIO1_IO00	ODE - DISABLED	
	ALT6	ECSPI3_SS0	SPEED - 100MHZ DSE - 40_OHM SRE - SLOW	
AUD_TXC	ALT0	AUD3_TXC	LVE - DISABLED	SW_PAD_CTL_PAD_AUD_TXC
	ALT1	ECSPI3_MISO	HYS - ENABLED	
	ALT2	UART4_TX_DATA	PUS - 100K_OHM_PD	
	ALT3	FEC_RX_DV	PUE - KEEP	
	ALT4	SD2_LCTL	PKE - ENABLED

# Chapter 5

## Fusemap

### 5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by BOOT\_CFG1[6:4] fuses listed in [Table 5-1](#).

**Table 5-1. Boot Device Select**

Boot Device	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]
EIM ( <a href="#">Table 5-2</a> )	0	0	0
Serial ROM ( <a href="#">Table 5-3</a> )	0	1	1
SD/eSD ( <a href="#">Table 5-4</a> )	1	0	X
MMC/eMMC ( <a href="#">Table 5-5</a> )	1	1	X

#### NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

## Chapter 6

# External Memory Controllers

### 6.1 Overview

This chip has the following external memory interfaces and controllers:

- Multi-mode DDR controller (MMDC)
- EIM-PSRAM/NOR Flash controller

### 6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that can support several types of DDR memories.

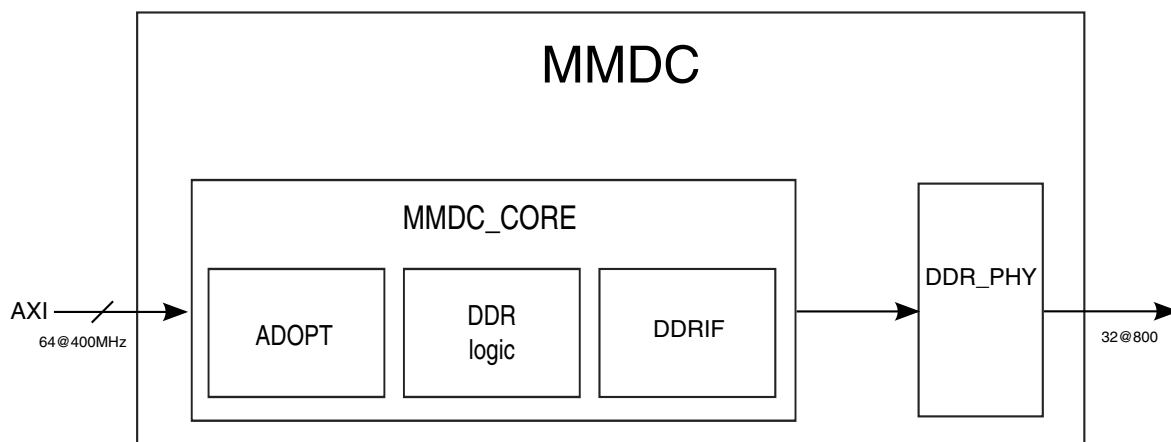

Figure 6-1. MMDC block diagram

**Table 6-1. MMDC feature summary**

Feature	Description
Supported standards	<ul style="list-style-type: none"> <li>• LV-DDR3, DDR3 x16, x32 (includes SODIMM)</li> <li>• LPDDR2 1ch x32</li> </ul>
DDR interface	<ul style="list-style-type: none"> <li>• x16, x32 data bus width</li> <li>• Density of 256 Mbytes-8 Gbytes <ul style="list-style-type: none"> <li>• Column size of 8-12 bits</li> <li>• Row size of 11-16 bits</li> </ul> </li> <li>• Up to 2 Gbyte address space and configurable address space per CS.</li> <li>• Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2</li> </ul>
DDR performance	<ul style="list-style-type: none"> <li>• DDR3 and LPDDR2 running at 400 MHz (800MT/s)</li> <li>• Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism</li> <li>• Page hit/page miss optimizations</li> <li>• Consecutive read/write access optimizations</li> <li>• Supports deep read and write requests queues to enable bank prediction</li> <li>• Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed)</li> <li>• Can track open memory pages</li> <li>• Supports bank interleaving</li> <li>• Special optimization for non-aligned wrap accesses in burst length 8</li> </ul>
AXI interface	<ul style="list-style-type: none"> <li>• AXI bus compliant with glueless interface to PL301 AXI network interconnect</li> <li>• Supports bus transfers of 8,16,32 bits (single accesses and bursts) running at 400 MHz</li> </ul>

DDR general	<ul style="list-style-type: none"> <li>• Configurable timing parameters</li> <li>• Configurable refresh scheme</li> <li>• Supports dynamic voltage, frequency change and low power mode entry through hardware negotiation with the system (req/ack handshake)</li> <li>• Supports automatic self-refresh and power down entry and exit</li> <li>• Supports fast and slow precharge power down in DDR3</li> <li>• Supports various ODT control schemes. <ul style="list-style-type: none"> <li>• Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS</li> </ul> </li> <li>• Supports MRW and MRR commands for LPDDR2.</li> <li>• Software control for moving to derated timing parameters and derated refresh rate according to temperature variation.</li> <li>• Supports various debug and profiling modes</li> </ul>

## 6.3 EIM-PSRAM/NOR Flash controller overview

EIM, which is an external interface module, handles the interface to devices that are external to the chip, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

### 6.3.1 EIM features

- Up to four (software configurable) chip selects for external devices
  - Flexible address decoding; each chip select memory space is determined separately according to the GPR bits in IOMUXC.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32MBytes.
- Selectable write protection for each chip select
- Support for multiplexed address/data bus operation x16 port size
- Programmable data port size for each chip select (x8 and x16 )
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Supports asynchronous page mode accesses (x16 port size)
- Supports a continuous burst clock that can be used as the reference clock for FPGA
- Independent synchronous memory burst read mode support for NOR-Flash and PSRAM memories (x16 port size)
- Independent synchronous memory burst write mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Supports NAND-Flash devices with NOR-Flash like interface - OneNAND™ (Samsung)
- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little endian operation
- ARM AXI slave interface accesses only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY\_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY\_INT signal
  - RDY signal support assertion after reset

- INT signal support assertion after reset for OneNAND™ (Samsung) device
- Supports little endian mode only

### 6.3.2 EIM boot scenarios

EIM allows booting from NOR Flash devices. To select NOR Flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See [Sytem Boot](#) for more information.

### 6.3.3 EIM boot configuration

The following table shows the EIM boot configuration.

**Table 6-2. EIM boot configuration**

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DZS[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2]	CS0GCR1
	WWSC[4:2]	CS0WCR
4	ERRST	WCR
3	RAL	CS0RCR1
	WAL	CS0WCR
2	MUM	CS0GCR1
	OEA[1]	CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

### 6.3.4 OneNAND requirements

Because Ready/Busy pin is not in use, OneNAND devices require the following actions:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the device to any GPIO pin and use it as an interrupt that indicates the on ready state.

# Chapter 7

## System Debug

### 7.1 Overview

This chapter describes the hardware and software debug and application development features and resources of the chip. It discusses the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM's CoreSight architecture, adapted to i.MX 6SoloLite SoC (for 1x core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third party tools
- TPIU, a trace port interface unit that efficiently accesses program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

### 7.2 Chip and Cortex-A9 Core Platform Debug Architecture

ARM Cortex-A9 Debug architecture is based on CoreSight architecture by ARM Ltd. The CoreSight architecture provides a system wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access debug functionality without software interaction;
- To connect to a running system without performing a reset.

Full access to the processor debug capability is available by the ARM Cortex-A9 debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit allow which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state and restarts the processor core.

## **7.2.1 Debug Features**

- CoreSight Program Trace Macrocell (PTM): trace generator for the ARM Cortex A9™ core
- Support for a TrustZone-related 3-level debug scheme:
  - Debug in Non-Secure privileged and user, and Secure user
  - Debug in Non-Secure only
- EmbeddedICE-RT logic
  - Support for both monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core- and memory-mapped resource examination/modification
- Data communication channel between ARM core and host debugger via JTAG, and the Debug Access Port (DAP) module.
- PMU: Performance Metrics Unit used for system profiling and debug.
- CP15 register for debugging the MMU, I & D L1 cache, and TLB
- PL310 L2 Cache: Provides an event monitoring signal routed to pins for visibility to help in system debug.

The chip includes ARM CoreSight components for multicore debug and trace solutions.

See the following figure for the ARM debug architecture scheme.

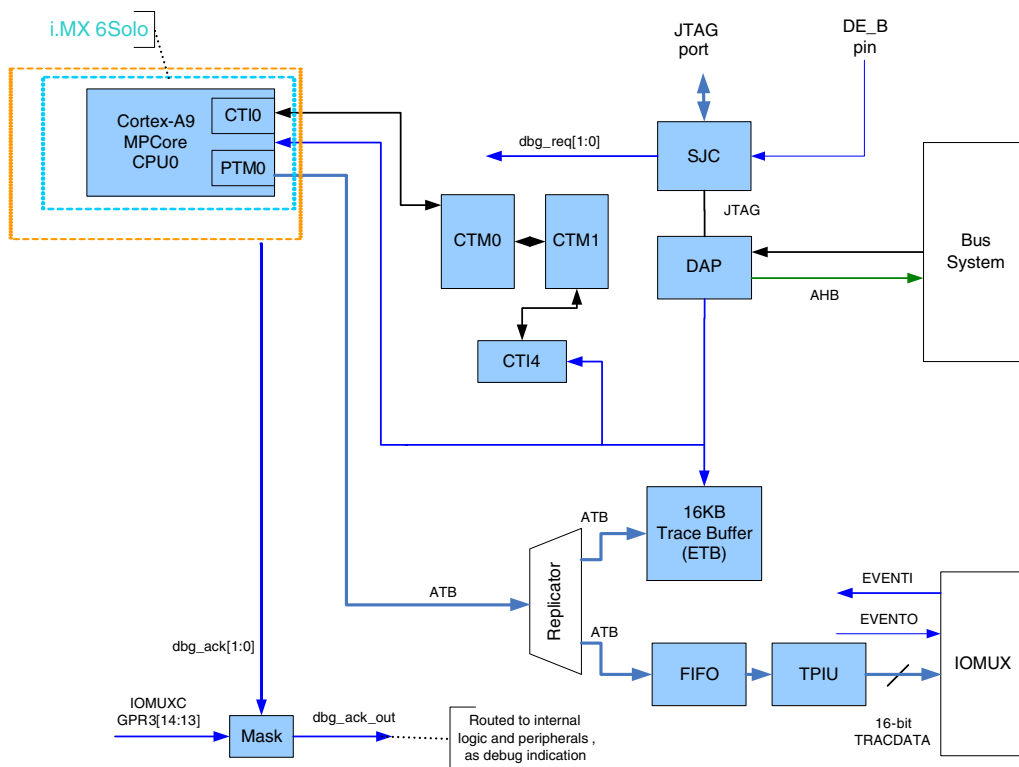

Figure 7-1. i.MX 6SoloLite Cortex-A9 Core Platform Debug Architecture

## 7.2.2 Debug System components

CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM
- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility, which selects critical signals routed to the I/O pads as alternate outputs for external visibility

### 7.2.2.1 AMBA trace bus (ATB)

ATB transfers trace data through the CoreSight infrastructure in a chip. Trace sources are ATB masters and sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine sources into a single trace stream.
- Association of the trace data with the generating source using trace source IDs. A CoreSight system can trace up to 111 different items at any one time.
- Capture and transfer of multiple byte bus widths, currently to 32 bits.
- A flushing mechanism to force historic trace to drain from any sources, links, or sinks up to the point that the request was initiated

### 7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—The ATB replicator accepts trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—The ATB replicator sends identical trace data on outgoing master port interfaces.

### 7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate debug state information from one core to another, so that program execution on both processors can be stopped at the same time if required.

The ECT consists of the following types of modules:

- Cross trigger interfaces (CTI)
- Cross trigger matrix (CTM)

Cross trigger interfaces provide the interface between a component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger request generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides Channel Interfaces (CIs) to connect to either CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a SWcontrolled debug signal matrix that receives signals from various sources (i.e. cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. Those debug resources can include time stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

#### NOTE

As the ECT should only be used during debug sessions, it is off (disabled) by default.

The chip's cross-triggering architecture consists of 2xCTMs and 2<sup>1</sup> CTIs covering three basic groups of functionality as follows:

- CTI 0 - for ARM core

#### 7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross Trigger Matrix) is provided by ARM. A brief description is provided below. It is advised to refer to ARM documentation for more details.

---

1. Depending on specific part: i.MX 6SoloLite.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in i.MX6SoloLite in ARM Platform.

One of them is used to route 1x Core's CTI's, while the second one, is used for additional CoreSight CTI. Each CTI has 4 channel lines, which CTI events are mapped to. The exact mapping is configured in the CTI logic.

#### 7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are 2 CTIs in the chip's ARM platform. One is of which, dedicated to each Core, while the 2nd is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see [../././block\\_guide\\_library/arm\\_a9/map\\_arm\\_a9.xml](#).

#### 7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access through AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
  - AHB Access Port (AHB-AP)
  - APB Access Port (APB-AP)
  - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

### 7.2.2.5 CoreSight trace port interface (TPIU)

TPIU is one of the CoreSight trace sink components. It acts as a bridge between the on-chip trace data and a data stream that is then driven out the trace port.

TPIU uses the ATB interface to accept trace data from a trace source, either directly or by using a trace funnel. TPIU has 32 bit port connected to the chip pad.

The APB interface is the programming interface for the TPIU configuration.

The features of the sub-blocks are as follows:

- Formatter—Inserts source ID signals into the data packet stream so that the trace data can be re-associated with the trace source.
- Asynchronous FIFO—Enables trace data to be driven out at a speed that is not dependent on the on-chip bus clock.
- Register Bank—Contains the management, control and status registers for triggers, flushing behavior and external control.
- Trace out—The Trace out block serializes the formatted data before it goes off-chip.
- Pattern Generator—The Pattern Generator unit provides a simple set of defined bit sequences or patterns that can be output over the Trace Port and be detected by the TPA or other associated Trace Capture Device (TCD). The TCD can use these patterns to indicate if it is possible to increase or decrease the trace port clock speed.

The TPIU accepts trace data from a trace source, either direct from a trace source or using a Trace Funnel. The APB interface is the programming interface for the TPIU. The Trace Clock driving the data out to external pins can be obtained from either an on chip or off chip source, selectable via a mux.

The output of the TPIU is connected via external pins (MPS of TRACEDATA in Figure 8-8, which can be in the range of 1–16 bits). The system may utilize double data rate pins to either use a lower clock speed than that of the 32-bit ATB interface, or use fewer than

32 data pins for the output, based on the ability of the technology used. Given the speed of the ATB, 32 data pins with double data rate is recommended, with the external interface running at half the speed of the ATB. The speed of the external interface is from TRACECLKIN, and should be selectable via an on chip or off chip clock. TRACECLK is equal to TRACECLKIN / 2, and is divided in the TPIU to clock trace data at the trace capture unit.

TPIU used to be part of the ARM platform sub blocks in previous versions of i.MX products, placing the TPIU off platform allows future debug trace sources from the chip level to connect to the TPIU by means of a funnel.

For more information, see [Program Trace Macrocell \(PTM\)](#)

## 7.2.3 i.MX6SoloLite-Specific SJC Features

### 7.2.3.1 JTAG Disable Mode

In addition to three different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

### 7.2.3.2 JTAG ID

**Table 7-1. i.MX JTAG ID**

Device	Silicon revision	JTAG ID (ID CODE)
i.MX 6SoloLite	Rev 1.0	0891_F01Dh <sup>1</sup>

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891\_F01Dh for Rev 1.1, 2891\_F01Dh for Rev 1.2 , etc.

## 7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

### NOTE

Single Wire Debug (SWD) protocol is not supported.

## 7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- Three levels of security, ranging from no security to no JTAG accessibility to the chip

## 7.2.6 SCJ TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

## 7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug\_Event pin

- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID\_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined (SOC integration team) control and status functions are supported by the SJC.

The user-defined functions will be defined and documented by the SOC integration team.

## **7.3 Smart DMA (SDMA) core**

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
  - SDMA core control - run/halt/single-step
  - SDMA core register/memory-map access
  - Event detection, watchpoints, and hardware breakpoints
  - Real time buffer and PC trace buffer capability
- Trace buffer
  - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
  - Includes information about all the channel dump activity
  - Current contents of SDMA RAM
- ROMPATCH

### 7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- **Memory And Register Access** - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- **Event Detection Unit** - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- **Watchpoints** - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- **Hardware Breakpoint** - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- **Real Time Buffer** - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- **Core Control (Core Status / Single Stepping)** - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- **Trace Buffer** - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

#### 7.3.1.1 Other SDMA Debug Functionality

- **Core Trace** - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- **ROM Patch** - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- **Additional debug control/status interaction with the SJC module**

- SJC-controlled Debug Request
- SJC-readable Debug Acknowledge (in debug mode)
- Debug clock control - allows SJC to force clocks on for debug purposes
- Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

### 7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE\_AFTER\_RESET mode. A debug request also puts the SDMA in its DEBUG\_IN\_IDLE\_AFTER\_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the exec\_core <instruction> SDMA OnCE instruction to return to the IDLE\_AFTER\_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

## 7.4 Miscellaneous

### 7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGIRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

Conversely, the debug system is capable of generating a system reset via a request bit in the MDM-AP control register. This allows the debugger to hold the system in reset.

## 7.5 Supported tools

RealView™ ARM Debugger is supported.

The debugger is connected to the chip from the host by the RealView ICE protocol converter. Other 3rd party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

# Chapter 8

## System Boot

### 8.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device configuration data (DCD) and plugin
- Digital signature High Assurance Boot (HAB)
- Wake-up from low power modes
- Plugin image

The boot ROM supports the following boot devices:

- NOR Flash
- OneNAND Flash
- SD/MMC
- Serial (I2C/SPI) NOR Flash and EEPROM

In normal operation, the Boot ROM uses the state of the `BOOT_MODE` register and eFUSES to determine the boot device. For development purposes, eFUSES used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is

downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see [Table 8-29](#)).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for SEC\_CONFIG is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 8.2 Boot modes

During reset, the chip checks ARM core ID and Power Gating Controller status register.

On normal boot, the core's behavior is defined by the Boot Mode pins settings as described in [Boot mode pin settings](#). On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT\_ENTRY0 (see [Persistent Bits](#)) is a pointer to valid address space (OCRAM, DDR or EIM). If PERSISTENT\_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT\_ENTRY0 register. If PERSISTENT\_ENTRY0 is a pointer to invalid range, the core performs system reset.

### 8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

BOOT\_MODE is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT\_MODE internal register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

**Table 8-1. Boot MODE Pin Settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

## 8.2.2 High level boot sequence

The figure found here shows the high-level boot ROM code flow.

**Figure 8-1. Boot Flow**

## NOTE

For External Interface Module (EIM) boot devices, downloading initial load region to iRAM is skipped. IVT is read from EIM address space (see [Image Vector Table and Boot Data](#)). Copying initial load region and the rest of the program image is done only if the absolute start address of the image is not equal to EIM CS0 start address.

### 8.2.3 Boot From Fuses Mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot Mode \(BOOT\\_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFUSE value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

The first time the BT\_FUSE\_SEL = 0 eFUSE is encountered, it is not blown (thus setting BT\_FUSE\_SEL). This forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the BT\_FUSE\_SEL and the other boot configuration eFUSES. After reset, the Boot ROM code determines that BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set BOOT\_MODE[1:0]=00b on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of BOOT\_MODE[1:0] or pullups/pulldowns on the BOOT\_MODE pins.

## 8.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG-1 for a 32-second time-out if WDOG\_ENABLE eFuse is 1, and then continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

### NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

Figure 8-2. USB Boot Flow

### 8.2.5 Internal Boot Mode (BOOT\_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT\_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSES in this mode. See [Table 8-4](#) for more details.

- If BT\_FUSE\_SEL = 1, all boot options are controlled by the eFUSES described in [Table 8-2](#).
- If BT\_FUSE\_SEL = 0, specific boot configuration parameters may be set using GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSES in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

## 8.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- **Closed:** This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.
- **Field Return:** This level is intended for parts returned from shipped products.

**NOTE**

If the DIR\_BT\_DIS eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

## 8.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

### 8.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

**Table 8-2. Boot eFUSE Descriptions**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
DIR_BT_DIS	OEM	Disables Freescale reserved modes. Must be set for secure boot.	NA	0	0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled
BT_FUSE_SEL	OEM	In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP).  In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed.	NA	0	If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings.  If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed.

*Table continues on the next page...*

**Table 8-2. Boot eFUSE Descriptions  
(continued)**

Fuse	Config uratio n	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
SEC_CONFIG[1:0]	SEC_CONFIG[0] - Freescale SEC_CONFIG[1] - OEM	Security Configuration as defined in <a href="#">Boot security settings</a>	NA	01	00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated)
FIELD_RETURN	OEM	Enables Freescale reserved modes			0 - Freescale reserved modes are enabled/disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled
SRK_HASH[255:0]	OEM	256-bit hash value of super root key (SRK_HASH)	NA	0	Settings vary - used by HAB
DIE-X-COORDINATE[7:0] DIE-Y-COORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0]	Freescale	Device Unique ID, 64-bit UID.	NA	Unique ID	Settings vary - used by HAB
BT_MMU_DISABLE	OEM	MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing	No	0	0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot
L1 I-Cache DISABLE	OEM	L1 I Cache disable bit used by boot during entire execution	No	0	0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot
BT_FREQ (BOOT_CFG2[2])	OEM	Frequency Selection	Yes	0	0 - ARM - 792MHz, DDR - 532MHz, AXI - 264MHz 1 - ARM - 396MHz, DDR - 352MHz, AXI - 176MHz
BOOT_CFG1[7:0]	OEM	Boot Configuration1	Yes	0	Specific to selected boot mode
BOOT_CFG2[7:0]	OEM	Boot Configuration2	Yes	0	Specific to selected boot mode
BOOT_CFG4[6:0]	OEM	Boot Configuration4		0	Specific to selected boot mode

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions  
(continued)**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
BOOT_CFG4[7]	OEM	Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0 - Disabled 1 - Enabled
LPB_BOOT	OEM	USB Low Power Boot	No	0	00 - LPB Disable 01 - 1 GPIO (default frequencies) 10 - Divide by 2 11 - Divide by 4
BT_LPB_POLARITY	OEM	USB Low Power Boot GPIO polarity	No	0	0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable SDMMC manufacture mode	No	0	0: enable SD/MMC MFG mode 1: disable SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for SD/MMC and NAND boot modes	No	0	Override the following IO PAD settings: PAD_SETTINGS[0] - Slew Rate PAD_SETTINGS[3:1] Drive Strength PAD_SETTINGS[5:4] - Speed Settings .
USE_L2_CACHE_AS_OCRAM (BOOT_CFG1[7])	OEM	L2 cache memory to be configured as OCRAM	Yes	0	0: L2 cache will be used as cache 1: L2 cache will be used as OCRAM <sup>3</sup>
OVERRIDE_HYS_SDMMC_PADS	OEM	Overrides HYS bit for SD pads	No	0	Override the IO PAD setting HYS to 1 for SD pads
eMMC_4.4_RESET_TO_PRE-IDLE_STATE	OEM	ROM reset the boot device in pre-idle state using eMMC 4.4 feature, CMD0 with argument value 0xf0f0f0	No	0	Applicable for booting from eMMC 4.4 spec or greater version devices. The fuse should not be blown for eMMC 4.3 or lesser spec version devices.

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse
3. L2 Cache will be locked after boot to prevent the leaking of cache contents.

## 8.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

**Table 8-3. GPIO Override Contact Assignments**

Package Pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot Mode Selection
BOOT_MODE0	Input	
LCD_DAT0	Input	BOOT_CFG1[0]
LCD_DAT1	Input	BOOT_CFG1[1]
LCD_DAT2	Input	BOOT_CFG1[2]
LCD_DAT3	Input	BOOT_CFG1[3]
LCD_DAT4	Input	BOOT_CFG1[4]
LCD_DAT5	Input	BOOT_CFG1[5]
LCD_DAT6	Input	BOOT_CFG1[6]
LCD_DAT7	Input	BOOT_CFG1[7]
LCD_DAT8	Input	BOOT_CFG2[0]
LCD_DAT9	Input	BOOT_CFG2[1]
LCD_DAT10	Input	BOOT_CFG2[2]
LCD_DAT11	Input	BOOT_CFG2[3]
LCD_DAT12	Input	BOOT_CFG2[4]
LCD_DAT13	Input	BOOT_CFG2[5]
LCD_DAT14	Input	BOOT_CFG2[6]
LCD_DAT15	Input	BOOT_CFG2[7]
LCD_DAT16	Input	BOOT_CFG4[0]
LCD_DAT17	Input	BOOT_CFG4[1]
LCD_DAT18	Input	BOOT_CFG4[2]
LCD_DAT19	Input	BOOT_CFG4[3]
LCD_DAT20	Input	BOOT_CFG4[4]
LCD_DAT21	Input	BOOT_CFG4[5]
LCD_DAT22	Input	BOOT_CFG4[6]
LCD_DAT23	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT\_FUSE\_SEL fuse. Table below describes boot options control sampling in different boot modes.

**Table 8-4. Boot Options Control Selection**

BOOT_MODE[1:0]	BT_FUSE_SEL Value	Boot Options Controlled By
00	0	eFUSEs
	1	

*Table continues on the next page...*

**Table 8-4. Boot Options Control Selection  
(continued)**

BOOT_MODE[1:0]	BT_FUSE_SEL Value	Boot Options Controlled By
01	0	GPIO pins
	1	eFUSES
10	0	GPIO pins
	1	eFUSES

### 8.3.3 Device Configuration Data

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on Device Configuration Data.

## 8.4 Device Initialization

This section describes the details on the ROM and provides initialization details.

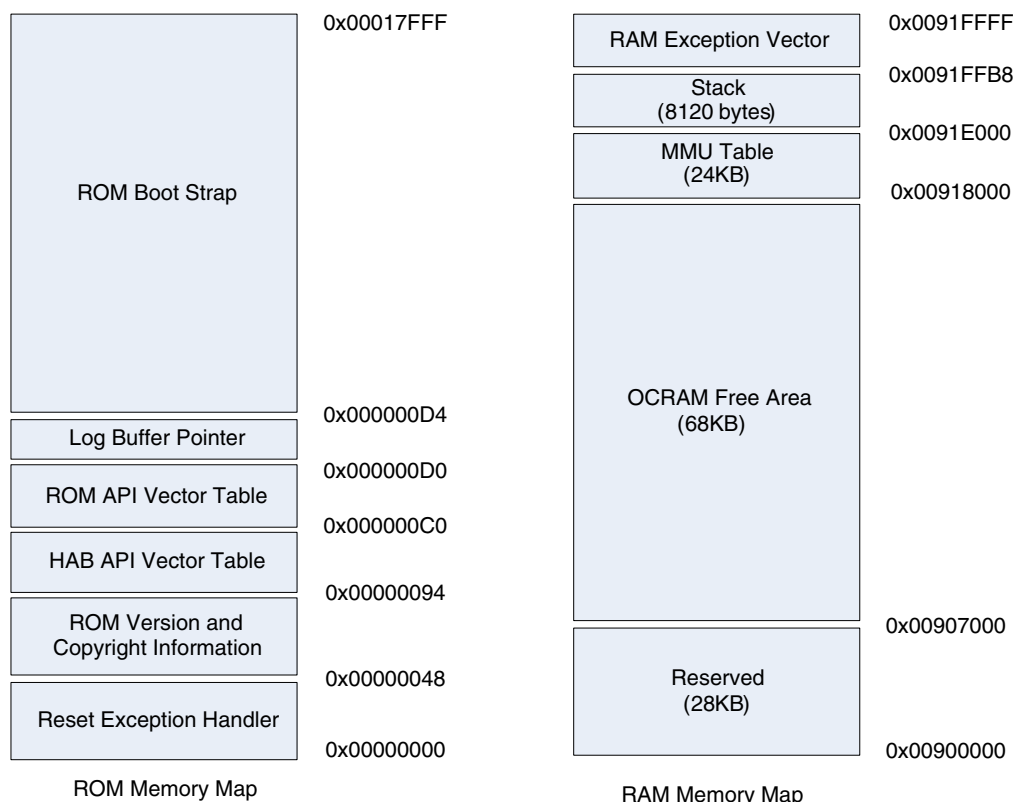

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache when performing a secure boot (SEC\_CONFIG = Closed)
- Exception handling and interrupt handling

### 8.4.1 Internal ROM /RAM memory map

[Figure 8-3](#) shows the iROM memory map for the i.MX 6SoloLite.

**Figure 8-3. Internal Rom and Ram memory map for i.MX 6SoloLite**

### NOTE

The entire OCRM region can be used freely post boot.

## 8.4.2 Boot Block Activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- CCM - Clock Control Module
- ECSPI - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices
- I2C - I2C Controller
- OCOTP\_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSES.

- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- DCP - Data CoProcessor Module for Hash acceleration
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer

### 8.4.3 Clocks at Boot Time

The table below shows the various clocks and their sources used by ROM.

**Table 8-5. Normal Frequency Clocks Configuration**

Clock	CCM signal	Source	Frequency(MHz) BT_FREQ=0	Frequency(MHz) BT_FREQ=1
System PLL	pll1_sw_clk		792	792
528MHz PLL	pll2_sw_clk		528	528
480MHz PLL	pll3_sw_clk		480	480
ARM core clock	arm_clk_root	System PLL	792	396
EIM	emi_slow_clk_root	528MHz PLL	132	132
AHB	ahb_clk_root	528MHz PLL/PFD307	132	76.6
IPG	ipg_clk_root	528MHz PLL/PFD307	66	38.3
AXI_A	axi_a	528MHz PLL/PFD307	396	306
AXI_B	axi_b	528MHz PLL/PFD352	264	153.3
USB	usb0h3_clk_root	480MHz PLL	60	60
USDHC	usdhc1_clk_root usdhc2_clk_root usdhc3_clk_root usdhc4_clk_root	PFD400	198	198
ECSPI	ecspi_clk_root	480MHz PLL	60	60
I2C	per_clk_root	528MHz PLL	66	38.3

Following reset, each ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the second column.

**Table 8-6. List Of Disabled Clocks**

Clock Name	Enabled For Boot Device
CCGR0_APBHDMA	
CCGR1_ECSP11	ECSP11
CCGR1_ECSP12	ECSP12
CCGR1_ECSP13	ECSP13
CCGR1_ECSP14	ECSP14
CCGR1_FEC	
CCGR1_EPIT1	
CCGR1_EPIT2	
CCGR2_I2C1_SERIAL	I2C1
CCGR2_I2C2_SERIAL	I2C2
CCGR2_I2C3_SERIAL	I2C3

CCGR6_USDHC4	USDHC4
CCGR6_EMI_SLOW	NOR, OneNAND

## 8.4.4 Enabling MMU and Caches

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed when performing a secure boot with SEC\_CONFIG=Closed ( [High Assurance Boot \(HAB\)](#)). L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L2 cache and MMU.

L1 Instruction cache is controlled by L1 I-Cache eFuse. By default the L1 I-Cache is enabled.

Enabling the MMU when booting non-securely with SEC\_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT\_MMU\_DISABLE fuse.

## 8.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

During the boot phase of a secondary CPU, the internal RAM vectors point to a function that sets the error status registers (see [Persistent Bits](#)), sends a wakeup error interrupt and performs the Wait For Interrupt instruction. The interrupt service routine of primary CPU must reconfigure the system and reset the secondary CPU.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

### Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP                                ; Reserved vector
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr
LDR    PC, SW_monitor_addr
;; Define exception vector table
Reset_Addr    DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
```

```

SWI_Addr      DCD      iRAM_SWI_Handler
Prefetch_Addr DCD      iRAM_Prefetch_Handler
Abort_Addr    DCD      iRAM_Abort_Handler
              DCD      0 ; Reserved vector
IRQ_Addr      DCD      iRAM_IRQ_Handler
FIQ_Addr      DCD      iRAM_FIQ_Handler
SW_monitor_add DCD      SW monitor exception
start_address DCD start ;reset handler vector

```

## 8.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

## 8.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

**Table 8-7. Persistent Bits**

Bit Name	Bit Location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds argument of entry function for CPU0 for waking-up from low power mode.

## 8.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bits and 32-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash) and I2C (via ECSPI and I2C blocks respectively)

The selection of external boot device type is controlled by BOOT\_CFG1[7:4] eFUSES. See the table below for more details.

**Table 8-8. Boot Device Selection**

BOOT_CFG1[7:4]	Boot Device
0000	NOR/OneNAND (EIM)
0001	Reserved
0011	Serial ROM (I2C/SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC

### 8.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

**Table 8-9. EIM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0000 - Boot from EIM Interface
BOOT_CFG1[3]	OEM	NOR/OneNAND Selection	Yes	0	0 - NOR 1 - OneNAND
BOOT_CFG2[7:6]	OEM	Muxing Scheme	Yes	00	00 - Muxed, 16-bit data (low half) interface 01 - Reserved 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved
BOOT_CFG2[5:4]	OEM	OneNAND Page Size	Yes	00	00 - 1K 01 - 2K 10 - 4K 11 - Reserved

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

#### 8.5.1.1 NOR Flash Boot Operation

Booting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

### 8.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

#### NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see [Image Vector Table and Boot Data](#)). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

**Figure 8-4. Program Image Layout on a OneNAND Flash Device**

Prior to accessing the OneNAND device, the Chip waits approximately 500  $\mu$ s after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500  $\mu$ s delay it can take an addition 70  $\mu$ s for the OneNAND device to load the Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

### 8.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

**Table 8-10. EIM IOMUX Pin Configuration**

Signal	Muxed	Not muxed
DATA0	KEY_COL0.alt3	LCD_DAT6.alt3
DATA1	KEY_ROW0.alt3	LCD_DAT7.alt3

## 8.5.2 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

### 8.5.2.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC-1, USDHC-2, USDHC-3, or USDHC-4 ports, based on setting of the BOOT\_CFG2[4:3] (Port Select) fuse or it's associated GPIO input value at boot. All USDHC ports support eMMC4.3 and eMMC4.4 fast boot.

See the table below for details.

**Table 8-11. USDHC Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:6]	OEM	Boot Device Selection	Yes	00	01 - Boot from USDHC Interfaces
BOOT_CFG1[5]	OEM	SD/MMC Selection	Yes	0	0 - SD/eSD/SDXC 1 - MMC/eMMC
BOOT_CFG1[4]	OEM	Fast Boot Support	Yes	0	0 - Normal Boot 1 - Fast Boot

*Table continues on the next page...*

**Table 8-11. USDHC Boot eFUSE Descriptions  
(continued)**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[3:2]	OEM	SD/MMC Speed Mode	Yes	00	MMC 0x - High Speed Mode 1x - Normal Speed Mode SD 0x - High/Normal 10 - SDR50 11 - SDR104
BOOT_CFG1[1]	OEM	SD Power Cycle Enable/ eMMC Reset Enable	Yes	0	MMC 0 - eMMC reset disabled 1 - eMMC reset enabled via SD_RST pad (on USDHC3 and USDHC4 only) SD 0 - No power cycle 1 - Power cycle enabled via SD_RST pad (on USDHC3 and USDHC4 only)
BOOT_CFG1[0]	OEM	SD Loopback Clock Source Sel(for SDR50 and SDR104 only)	Yes	00	0 - through SD pad 1 - direct
BOOT_CFG2[7:5]	OEM	Bus Width/SD Calibration Step	Yes	000	SD/eSD/SDXC (BOOT_CFG1[5]=0) Bus Width xx0 - 1-bit xx1 - 4-bit SD Calibration Step 00x - 1 delay cells 01x - 1 delay cells 10x - 2 delay cells 11x - 3 delay cells MMC/eMMC (BOOT_CFG1[5]=1) 000 - 1-bit 001 - 4-bit 010 - 8-bit 101 - 4-bit DDR (MMC 4.4) 110 - 8-bit DDR (MMC 4.4) Else - reserved.

*Table continues on the next page...*

**Table 8-11. USDHC Boot eFUSE Descriptions  
(continued)**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG2[4:3]	OEM	Port Select	Yes	00	00 - USDHC-1 01 - USDHC-2 10 - USDHC-3 11 - USDHC-4
BOOT_CFG2[2]	OEM	DLL Override (eMMC Only)	Yes	0	0 - Boot ROM default. 1 - Apply value per fuse field MMC_DLL_DLY[6:0]
BOOT_CFG2[1]	OEM	Boot Acknowledge Disable / Pull-Down During Power Cycle Enable	Yes	0	MMC 0 - Boot Acknowledge Enabled. 1 - Boot Acknowledge Disabled. SD 0 - Use default SD pad settings during power cycle 1 - Set pull-down on SD pads during power cycle (used only if "SD Power Cycle Enable" enabled)
BOOT_CFG2[0]	OEM	Override Pad Settings	Yes	0	0 - Use default values 1 - Use PAD_SETTINGS values
MMC_DLL_DLY[6:0]	OEM	MMC DLL Value / UHSI Calibration Start Value	No	0000000	MMC DLL Value / UHSI Calibration Start Value

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST\_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of USDHC-1,2,3,4 blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

**NOTE**

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

**Table 8-12. SD/MMC Frequencies**

	SD	MMC	MMC (DDR Mode)
Identification (KHz)	347.22		
Normal Speed Mode (MHz)	25	20	25
High Speed Mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

**NOTE**

The boot ROM code reads application image length and application destination pointer from image.

**8.5.2.2 MMC and eMMC Boot**

The following table provides MMC and eMMC boot details.

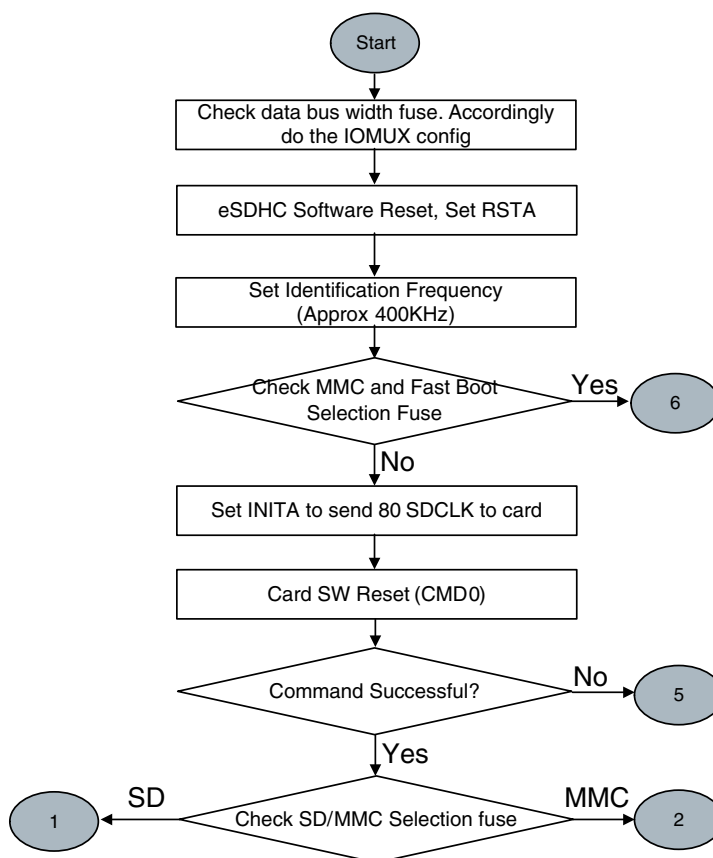

**Table 8-13. MMC and eMMC Boot Details**

Normal Boot Mode	<p>During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in BOOT_PARTITION_ENABLE field or the user partition has been mentioned, ROM boots from the user partition.</p>
------------------	--

*Table continues on the next page...*

**Table 8-13. MMC and eMMC Boot Details (continued)**

eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode	If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via DATA lines and ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without BOOT ACK. If BOOT ACK is enabled ROM waits 50 ms to get the BOOT ACK and if BOOT ACK is received by ROM. If BOOT ACK is disabled ROM waits 1 second for data. If BOOT ACK or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse. BOOT ACK is selected by BOOT_CFG2[1].
eMMC4.4 Device	If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse.

**Figure 8-5. Expansion Device Boot Flow (1 of 6)**

## Boot Devices (Internal Boot)

**Figure 8-11. Expansion Device Boot Flow (6 of 6)**  
i.MX 6SoloLite Applications Processor Reference Manual, Rev. 1, 04/2013

### 8.5.2.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST\_BOOT mode booting from eSD card. This mode can be selected by BOOT\_CFG1[4] (Fast Boot) fuse described in [Table 8-11](#).

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC3 and USDHC4 ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT\_CFG1[3:2], and the SD Loopback Clock is selected by BOOT\_CFG1[0].

UHSI calibration start value (MMC\_DLL\_DLY[6:0]) and step value (BOOT\_CFG2[7:5]) can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD\_RST pad low, wait 5ms and then set SD\_RST pad high. If SD\_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

### 8.5.2.4 IOMUX Configuration for SD/MMC

**Table 8-14. SD/MMC IOMUX Pin Configuration**

Signal	USDHC-1	USDHC-2	USDHC-3	USDHC-4

1. Active low

### 8.5.2.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST\_SECONDARY\_BOOT setting (see [Table 8-7](#)).

If PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST\_SECONDARY\_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

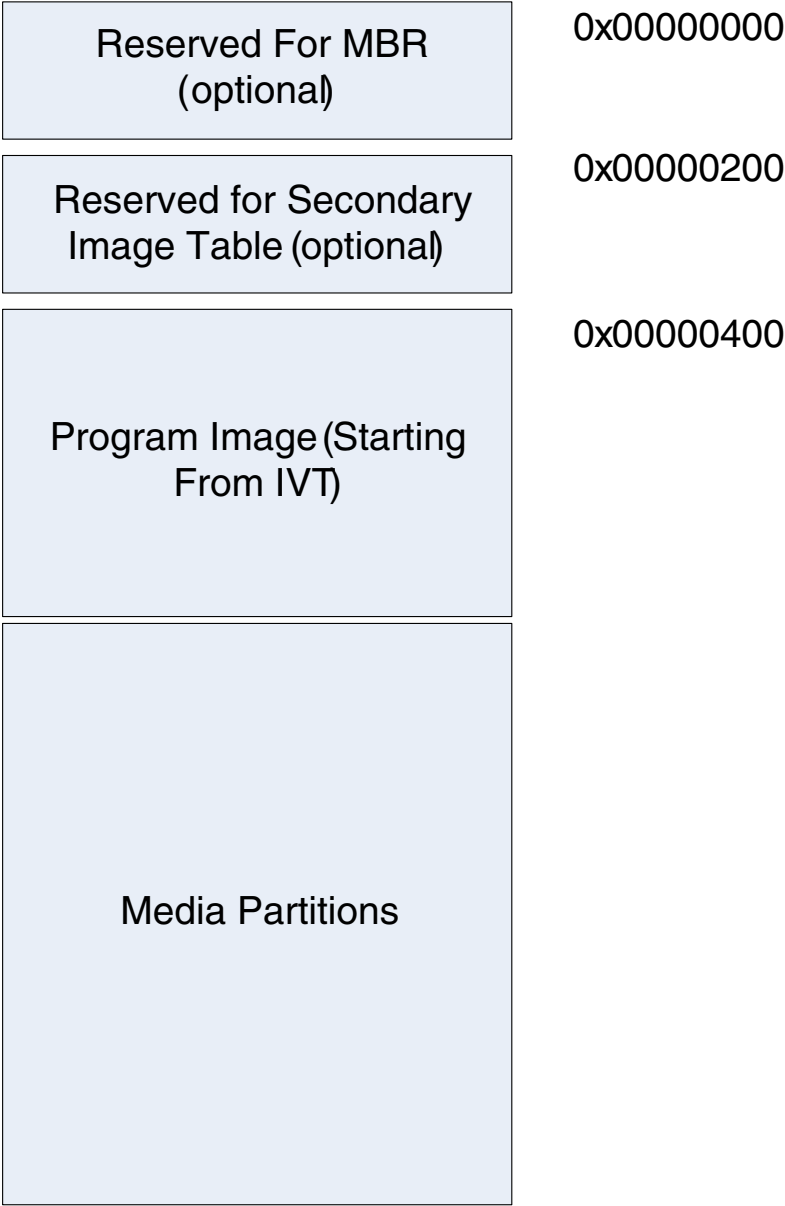

**Table 8-15. Secondary Image Table Format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

**Figure 8-12. Expansion Device Structures Layout**

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST\_SECONDARY\_BOOT bit (see [Table 8-7](#)) and perform software reset. (After software reset, secondary image will be used.)

### 8.5.3 Serial ROM through SPI and I2C

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: ECSPI ( ECSPI-1, ECSPI-2, ECSPI-3, ECSPI-4, ECSPI-5), and I2C Controller ( I2C-1, I2C-2 and I2C-3) interfaces.

#### 8.5.3.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

**Table 8-16. Serial ROM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0011 - Boot from Serial ROM
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPiX_SS0 01 - ECSPiX_SS1 10 - ECSPiX_SS2 11 - ECSPiX_SS3
BOOT_CFG4[3]	OEM	SPI Addressing (SPI only)	Yes	0	0 - 2-bytes (16-bit) 1 - 3-bytes (24-bit)
BOOT_CFG4[2:0]	OEM	Port Select	Yes	00	000 - ECSPI-1 001 - ECSPI-2 010 - ECSPI-3 011 - ECSPI-4 101- I2C-1 110- I2C-2 111- I2C-3

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as boot device using ECSPI interface for serial ROM boot. The SPI interface is configured to operate at 15MHz for 3-byte addressing device and 3.75MHz for 2-byte addressing devices.

The I2C-1/I2C-2/I2C-3 block can be used as boot device using I2C interface, for serial ROM boot. The I2C interface is configured to operate at 343.75 Kbps.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

### NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

### 8.5.3.2 I2C Boot

The boot flow when booting from an I2C device is shown in [Figure 8-13](#).

The boot ROM code reads the fuses BOOT\_CFG1[7:4] (Boot Device Selection) and BOOT\_CFG1[7:4] (Port select) to detect EEPROM device type. The ROM program copies 4K data from the EEPROM device to internal RAM. The boot ROM code next copies the initial 4Kbyte of data as well as rest of image directly to application destination extracted from application image.

The chip uses the Device Select Code/Device Address in the table below to boot from an EEPROM.

**Table 8-17. EEPROM via I2C Device Select Code**

Bits	Device Type Identifier				Chip Enable Address <sup>1</sup>			R/W
	7	6	5	4	3	2	1	0
Device Select Code	1	0	1	0	0	0	0	R/W

1. These address bits, should be configured at the memory device, to match this '000' value.

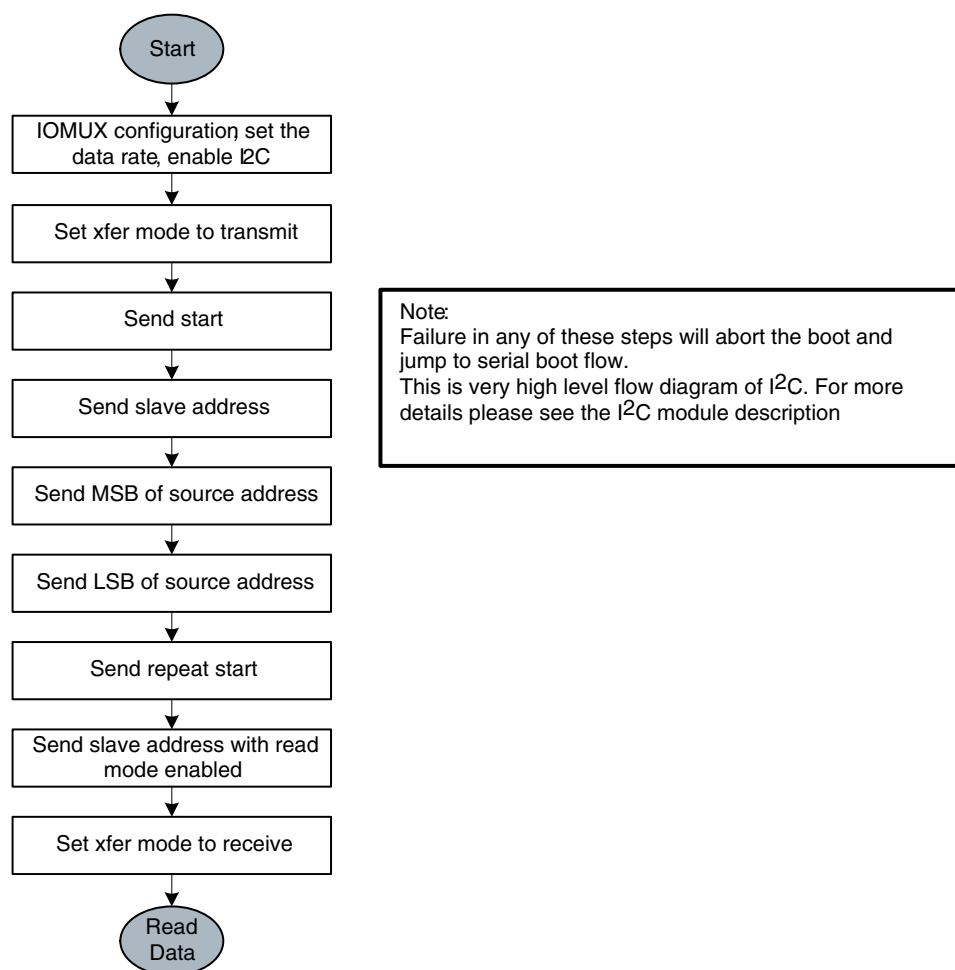

Figure 8-13. I2C Flow Chart

### 8.5.3.2.1 I2C IOMUX Pin Configuration

The contacts assigned to the signals used by the three I2C blocks is shown in the table below.

Table 8-18. I2C IOMUX Pin Configuration

Signal	I2C-1	I2C-2	I2c-3
SDA	I2C1_SCL.alt0	I2C2_SCL.alt0	AUD_RXFS.alt4
SCL	I2C1_SDA.alt0	I2C2_SDA.alt0	AUD_RXC.alt4

### 8.5.3.3 ECSPI Boot

The Enhanced Configurable SPI (ECSPI) interface is configured in master mode and the EEPROM device is connected to ECSPI interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPI can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

#### NOTE

The Serial ROM Chip Select Number is determined by  
BOOT\_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see [Table 8-16](#) for details).

Figure 8-14. CSPI Flow chart

### 8.5.3.3.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the three CSPI blocks is shown in the table below.

**Table 8-19. SPI IOMUX Pin Configuration**

Signal	ECSPI-1	ECSPI-2	ECSPI-3	ECSPI4	ECSPI-5
<b>MISO</b>	ECSPI1_MISO.alt0	ECSPI2_MISO.alt0	EPDC_D9.alt1	EPDC_D1.alt1	N/A
<b>MOSI</b>	ECSPI1_MOSI.alt0	ECSPI2_MOSI.alt0	EPDC_D8.alt1	EPDC_D0.alt1	N/A
<b>RDY</b>	N/A <sup>1</sup>	N/A	N/A	N/A	N/A
<b>SCLK</b>	ECSPI1_SCLK.alt0	ECSPI2_SCLK.alt0	EPDC_D11.alt1	EPDC_D3.alt1	N/A
<b>SS0</b>	ECSPI1_SS0.alt0	ECSPI2_SS0.alt0	EPDC_D10.alt1	EPDC_D2.alt1	N/A
<b>SS1</b>	I2C1_SCL.alt6	EPDC_SDCE0.alt1	EPDC_D12.alt6	EPDC_D4.alt1	N/A
<b>SS2</b>	I2C1_SDA.alt6	EPDC_GDCLK.alt1	EPDC_D13.alt6	EPDC_D5.alt1	N/A
<b>SS3</b>	ECSPI2_SS0.alt1	EPDC_GDOE.alt1	EPDC_D14.alt6	EPDC_D6.alt1	N/A

1. N/A in the ROM code indicates the pins are not available or not used.

## 8.6 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

### 8.6.1 Image Vector Table and Boot Data

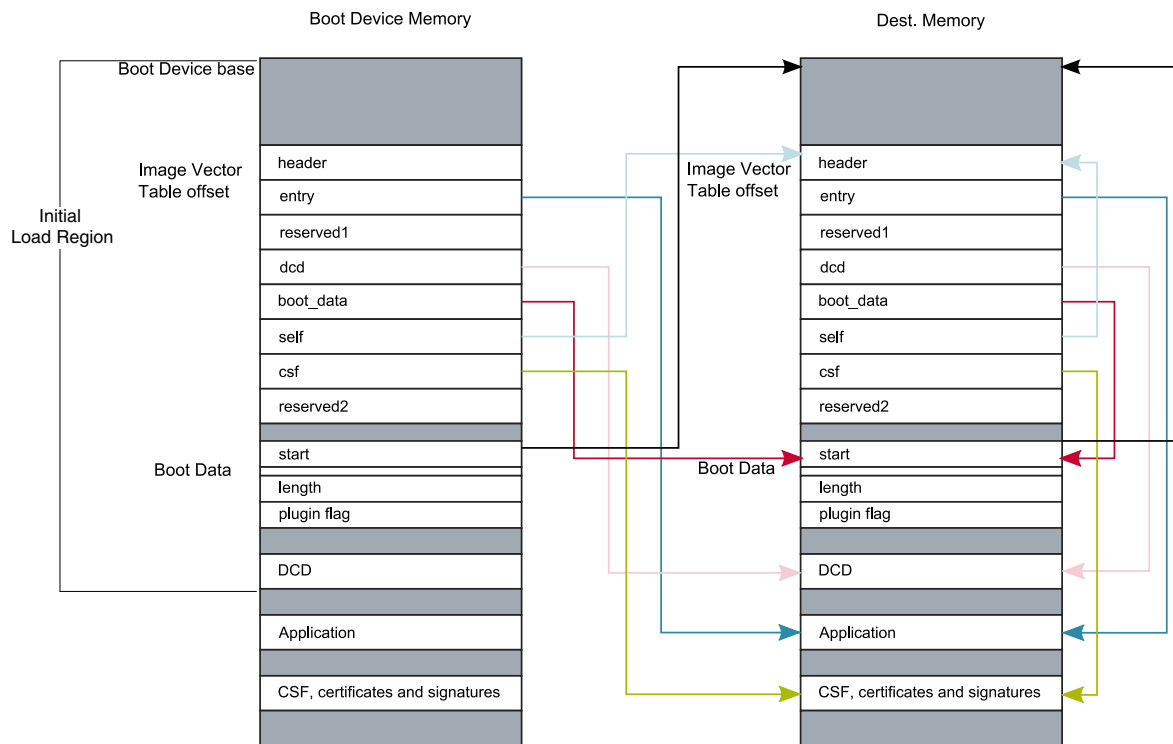

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device

type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

**Table 8-20. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
I2C/SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

**Figure 8-15. Image Vector Table**

### 8.6.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

**Table 8-21. IVT Format**

header
--------

*Table continues on the next page...*

**Table 8-21. IVT Format (continued)**

entry:	Absolute address of the first instruction to execute from the image
reserved1:	Reserved and should be zero
dcd:	Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on DCD.
boot data:	Absolute address of the Boot Data
self:	Absolute address of the IVT. Used internally by the ROM
csf:	Absolute address of Command Sequence File (CSF) used by the HAB library. See <a href="#">High Assurance Boot (HAB)</a> for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2:	Reserved and should be zero

The IVT header has the following format:

**Table 8-22. IVT Header Format**

Tag	Length	version
-----	--------	---------

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

### 8.6.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 8-23. Boot Data Format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin Image</a> )

## 8.6.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

**Table 8-24. DCD Data format**

Header
[CMD]
[CMD]
...

The DCD header is 4 bytes with the following format:

**Table 8-25. DCD Header**

Tag	Length	Version
-----	--------	---------

where:

Tag: A single byte field set to 0xD2

Length: a two byte field in big endian format containing the overall length of the DCD, in bytes, including the header

Version: A single byte field set to 0x41

### 8.6.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

**Table 8-26. Write Data Command Format**

Tag	Length	Parameter
-----	--------	-----------

*Table continues on the next page...*

**Table 8-26. Write Data Command Format (continued)**

Address
Value/Mask
[Address]
[Value/Mask]
...
[Address]
[Value/Mask]

where:

Tag: A single byte field set to 0xCC

Length: A two byte field in big endian format containing the length of the Write Data Command, in bytes, including the header

Address: target address to which data should be written

Value/Mask: data value or bitmask to be written to preceding address

The Parameter field is a single byte divided into bitfields as follows:

**Table 8-27. Write Data Command Parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 8-28. Interpretation of Write Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address  = val_msk	Set bitmask

**NOTE**

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

**Table 8-29. Valid DCD Address Ranges**

Address range	Start address	Last Address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
CCM register set	0x020C4000	0x020C7FFF
MMDC register set	0x021B0000	0x021B7FFF
IRAM Free Space	0x00907000	0x00937FF0
EIM - Memory	0x08000000	0x0FFEFFFFF
EIM - Registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFFFFFF

**8.6.2.2 Check Data Command**

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

**Table 8-30. Check Data Command Format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: A single byte field set to 0xCF

Length: A two byte field in big endian format containing the length of the Check Data Command, in bytes, including the header

Address: source address to test

## Program image

Mask: bit mask to test

Count: optional poll count. If count is not specified this command will poll indefinitely until the exit condition is met. If count = 0, this command behaves as for NOP.

The Parameter field is a single byte divided into bitfields as follows:

**Table 8-31. Check Data Command Parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 8-32. Interpretation of Check Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask) != mask	Any bit clear
1	1	(*address & mask) != 0	Any bit set

### NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

### 8.6.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

**Table 8-33. NOP Command Format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: A single byte field set to 0xC0

Length: A two byte field in big endian containing the length of the NOP Command in bytes.  
Fixed to a value of 4.

Undefined: This byte is ignored and can be set to any value.

### 8.6.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

**Table 8-34. Unlock Command Format**

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: A single byte field set to 0xB2

Eng: Engine to be left unlocked, supported engines are SNVS and OCOTP.

Values: [optional] unlock values required by engine. Valid values are:

for SNVS: 0x01 (HAB\_SNVS\_UNLOCK\_LP\_SWR) - leave LP SW reset unlocked (leave LP\_SWR bit cleared in register SNVS\_HP command register) and  
0x02 (HAB\_SNVS\_UNLOCK\_ZMK\_WRITE) - leave zeroisable master key write unlocked (leave ZMK\_WSL bit cleared in register SNVS\_HP lock register).

for OCOTP:

0x01 (HAB\_OCOTP\_UNLOCK\_FIELD\_RETURN) - leave field return activation unlocked in OCOTP\_SW\_STICKY register,

0x02 (HAB\_OCOTP\_UNLOCK\_SRK\_REVOKE) - leave SRK revocation unlocked in OCOTP\_SW\_STICKY register,

0x04 (HAB\_OCOTP\_UNLOCK\_SCS) - leave lock bit cleared in OCOTP\_SCS register and

0x08 (HAB\_OCOTP\_UNLOCK\_JTAG) - leave HAB\_JDE bit cleared in OCOTP\_SCS register to unlock JTAG.

#### NOTE

This command may not be used in DCD structure if the SEC\_CONFIG is configured as closed.

## 8.7 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot Data Structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See [High level boot sequence](#) for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef unsigned char (*) plugin_download_f(void **start, size_t *bytes, UINT32
*ivt_offset)
```

### ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt\_offset - Offset in bytes of the IVT from the image start address on exit.

### RETURN VALUE:

- 1 - on success
- 0 - on failure

## 8.8 Serial Downloader

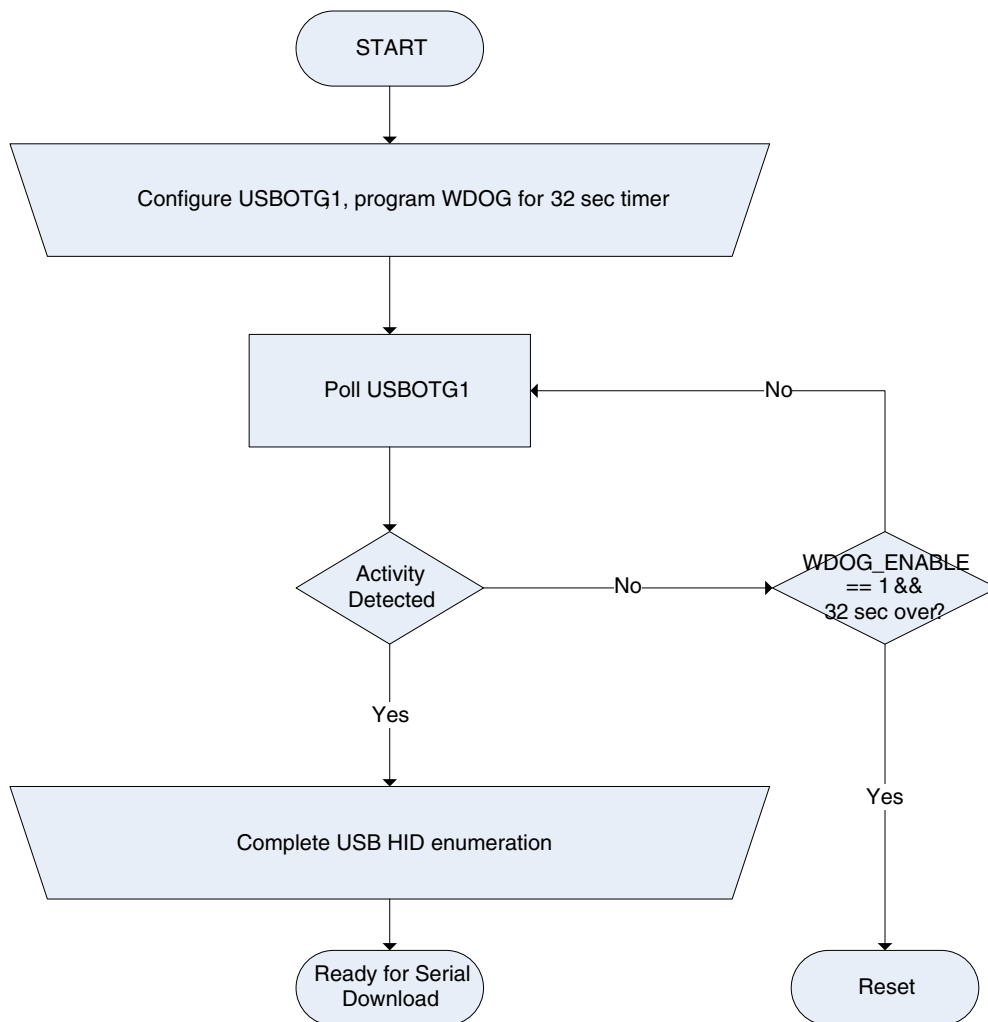

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG-1 for a 32-second time-out if WDOG\_ENABLE eFuse is 1, and then continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

**NOTE**

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

**Figure 8-16. USB Boot Flow**

### 8.8.1 USB

USB support is composed of the USBOH3 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in [Table 8-35](#).

**Table 8-35. USB HID Reports**

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
1	control OUT	Host to device	17 bytes	SDP command from host to device
2	control OUT	Host to device	Up to 1025 bytes	Data associated with report 1 SDP command
3	interrupt	Device to host	5 bytes	HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode.
4	interrupt	Device to host	Up to 65 bytes	Data in response to SDP command in report 1

### 8.8.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

**Table 8-36. VID/PID and Strings for USB Device Driver**

Descriptor	Value
VID	0x15A2 (Freescale vendor ID)
PID <sup>1</sup>	
String Descriptor1 (manufacturer)	Freescale Semiconductor, Inc.
String Descriptor2 (product)	S Blank SE Blank NS Blank
String Descriptor4	Freescale Flash
String Descriptor5	Freescale Flash

1. Allocation based on BPN (Before Part Number)

### 8.8.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

## 8.8.2 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

**Table 8-37. 16 Byte SDP Command Data Structure**

BYTE Offset	Size	Name	Description
0	2	COMMAND TYPE	The following commands are supported for ROM: <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0x0A0A DCD_WRITE</li> <li>• 0x0B0B JUMP_ADDRESS</li> </ul>
2	4	ADDRESS	Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.  For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units.
11	4	DATA	Value to write. Only relevant for WRITE_REGISTER command.
15	1	RESERVED	Reserved

### 8.8.2.1 SDP Command

SDP commands are described in the following sections.

### 8.8.2.1.1 READ REGISTER

The transaction for command READ\_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

1	Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register Value
---	----------------

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

4	Register Value
---	----------------

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

### 8.8.2.1.2 WRITE REGISTER

The transaction for command WRITE\_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE\_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE\_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

### 8.8.2.1.3 WRITE\_FILE

The transaction for command WRITE\_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA\_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

=====Optional Begin=====

Host sends ERROR\_STATUS command to query if HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

#### 8.8.2.1.4 ERROR\_STATUS

The transaction for SDP command ERROR\_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR\_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	4 bytes Error status
---	----------------------

ID first 4 bytes status in 64 bytes report 4

### 8.8.2.1.5 DCD WRITE

The SDP command DCD\_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used for temporary location of DCD data and DATA\_COUNT to number of bytes sent in data out phase. In data phase host sends data for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE\_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See [Device Configuration Data \(DCD\)](#) for DCD format description.

### 8.8.2.1.6 JUMP ADDRESS

The SDP command JUMP\_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE\_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

4	4 bytes HAB error status
---	--------------------------

ID 4 bytes status, 64 bytes report length

## 8.9 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of I2C or ECSPI ports.

For enabling recovery device BOOT\_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in [Serial ROM through SPI and I2C](#).

## 8.10 USB Low Power Boot

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max.1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 100mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB\_BOOT fuses are blown, the Chip will check if there is low power condition via GPIO\_3 pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB\_BOOT fuses value (see the table below). Polarity of low power boot condition on GPIO\_3 pad is set by BT\_LPB\_POLARITY fuse (see the figure below).

**Table 8-60. USB Low Power Boot Frequencies**

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
00	ARM_CLK_ROOT=792MHz MMDC_CH0_AXI_CLK_ROOT=528MHz MMDC_CH1_AXI_CLK_ROOT=528MHz AXI_CLK_ROOT=264MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CH0_AXI_CLK_ROOT=352MHz MMDC_CH1_AXI_CLK_ROOT=352MHz AXI_CLK_ROOT=176MHz AHB_CLK_ROOT=88MHz
01	ARM_CLK_ROOT=792MHz MMDC_CH0_AXI_CLK_ROOT=528MHz MMDC_CH1_AXI_CLK_ROOT=528MHz AXI_CLK_ROOT=264MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CH0_AXI_CLK_ROOT=352MHz MMDC_CH1_AXI_CLK_ROOT=352MHz AXI_CLK_ROOT=176MHz AHB_CLK_ROOT=88MHz
10	ARM_CLK_ROOT=396MHz MMDC_CH0_AXI_CLK_ROOT=264MHz MMDC_CH1_AXI_CLK_ROOT=264MHz AXI_CLK_ROOT=132MHz AHB_CLK_ROOT=66MHz	ARM_CLK_ROOT=264MHz MMDC_CH0_AXI_CLK_ROOT=176MHz MMDC_CH1_AXI_CLK_ROOT=176MHz AXI_CLK_ROOT=88MHz AHB_CLK_ROOT=44MHz
11	ARM_CLK_ROOT=264MHz MMDC_CH0_AXI_CLK_ROOT=132MHz MMDC_CH1_AXI_CLK_ROOT=132MHz AXI_CLK_ROOT=66MHz AHB_CLK_ROOT=66MHz	ARM_CLK_ROOT=132MHz MMDC_CH0_AXI_CLK_ROOT=88MHz MMDC_CH1_AXI_CLK_ROOT=88MHz AXI_CLK_ROOT=44MHz AHB_CLK_ROOT=44MHz

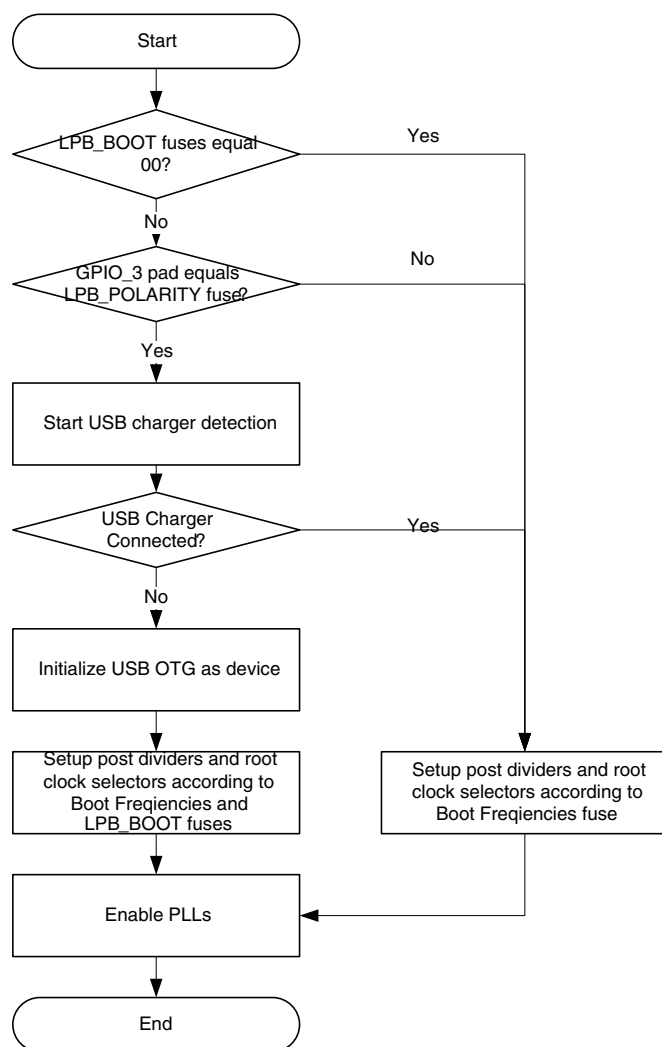

Figure 8-17. USB Low Power Boot Flow

## 8.11 SD/MMC Manufacture Mode

When internal boot and recover boot (if enabled) failed, boot will go to SD/MMC manufacture mode before serial download mode. In manufacture mode, one bit bus width is used despite of the fuse setting.

In manufacture mode, SD or MMC card will be scanned on uSDHC1 only. If card is detected and valid boot image is found in card, then boot image will be loaded then executed. Pad of SD1\_CD is used to detect whether card is inserted.

By default, SD/MMC manufacture mode is enabled, blow the fuse of DISABLE\_SDMMC\_MFG to disable it.

### NOTE

Secondary boot is not supported on SD/MMC manufacture mode.

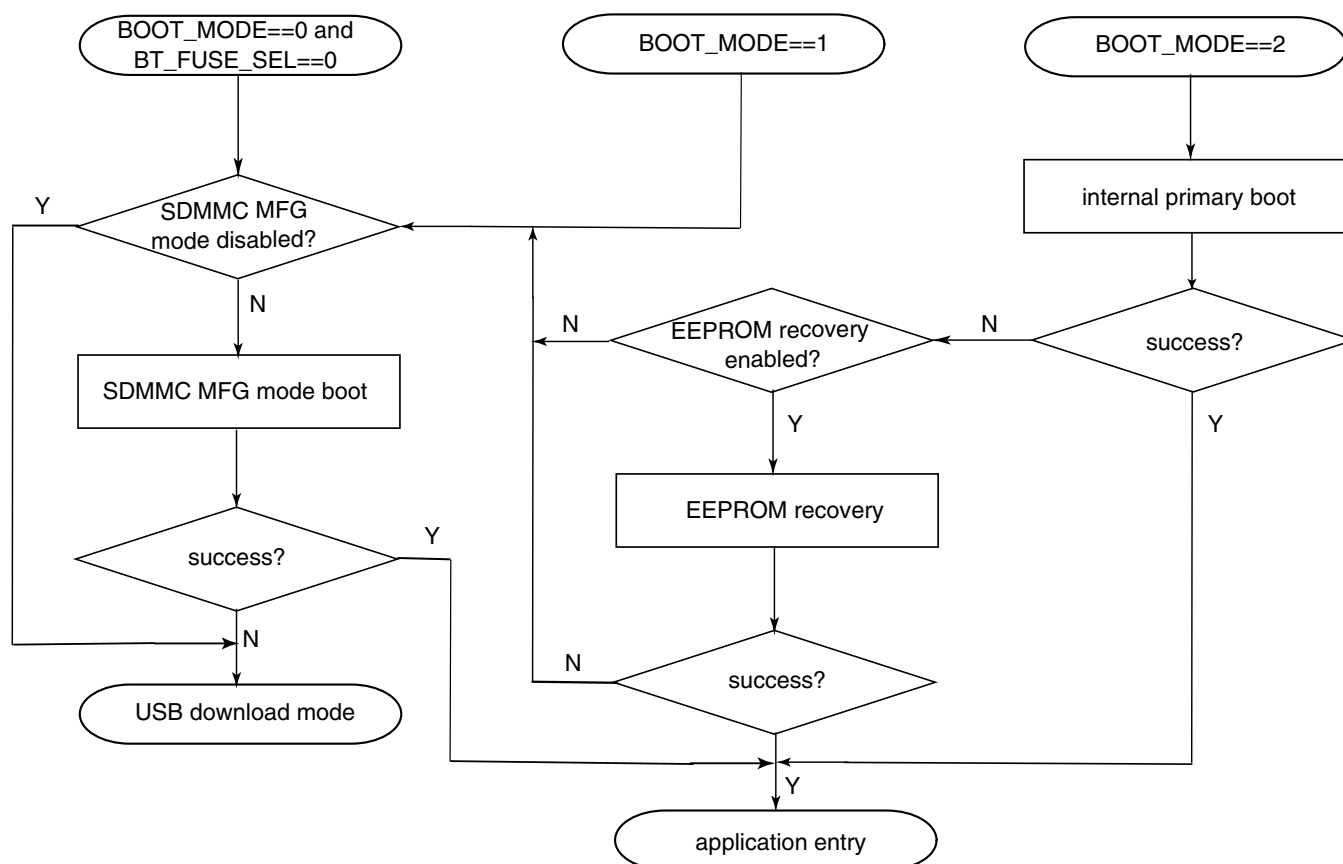

Figure 8-18. SD/MMC Manufacture boot flow

## 8.12 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

**Figure 8-19. Secure Boot Components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of DCP hardware block to accelerate SHA-256 message digest operations performed during signature verifications. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support
- CMS signature format support

#### **NOTE**

Freescall provides a reference Code Signing Tool (CST) for key generation, certificate generation and code signing for use with the HAB library. The CST can be found by searching for "IMX\_CST\_TOOL" at <http://www.freescall.com>.

#### **NOTE**

For further details on making use of the secure boot feature using HAB contact your local Freescall representative.

### 8.12.1 ROM Vector Table Addresses

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code. The RVT table contains the pointers to the HAB API functions and is located at 0x00000094.

#### NOTE

For additional information on secure boot including the HAB API, contact your local Freescale representative.

## Chapter 9

# Multimedia

### 9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- EPDC (electrophoretic display controller): display controller for E-INK EPD panel
- SPDC (SiPix display controller): display controller for SiPix EPD panel
- LCDIF (LCD interface): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: pixel/image processing engine for EPD and LCD display;
- Two graphic processing units:
  - GPU2D: acceleration the generation of 2D graphics (BitBLT).
  - GPUVG: acceleration of vector graphics (OpenVG).
- CSI (camera sensor interface): up to 16-bit parallel interface for image sensor

The following figure shows the high level integration scheme of the chip display and graphics system.

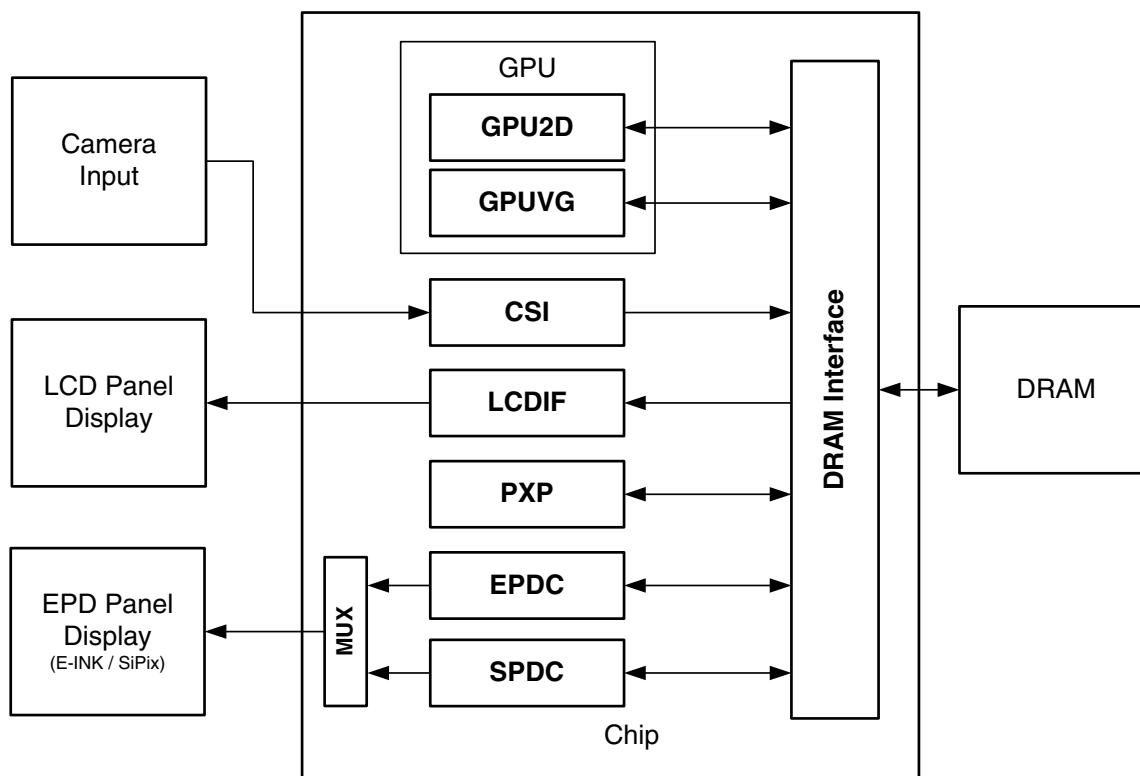

Figure 9-1. Chip display and graphics subsystem

### 9.1.1 Electrophoretic Display Controller

The EPDC is a feature-rich, low power, and high-performance direct-drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution whilst reaching much higher levels of performance and lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the ePXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- Supports direct-driver for E-Ink EPD panels, with up to 2048x1536 resolution at 106 Hz refresh rate (or 4096x4096 resolution at 20 Hz refresh rate)
- Supports up to 64 LUT for concurrent update
- Supports automatic waveform selection based on both input image and current panel content
- Supports collision detection
- Supports both PVI panels and LGD GIP panels.

### 9.1.2 SiPix Display Controller

SiPix Display Controller is used to drive EPD panels based on SiPix technology. The main feature of this controller includes:

- Supports direct driver for SiPix EPD panels with up to 1600x1200.
- Support 8-bit / 16-bit panel interface.

### 9.1.3 PiXel Pipeline

The pixel pipeline is used to perform image processing on image/video buffers before sending to an LCD display or EPD display. It supports basic image operations including resizing, overlay, rotation, as well as CSC and CFA operation used for EPD display.

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling
- Supports overlay with Alpha blending
- RGB656/RGB444 to RGBW4444 conversion with LUT for color EPD panel

### 9.1.4 LCD Interface

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The LCDIF block supports these different interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.

- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation

### **9.1.5 CMOS Sensor Interface**

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 32-bit receive FIFO packing.
- 128 × 32 FIFO to store received image pixel data. Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

### **9.1.6 2D Graphics Processing Unit (GPU2Dv2)**

### 9.1.6.1 2D feature summary

GPU2D has the following features:

- Bit BLT & stretch BLT
- Rectangle fill and clear
- Line drawing
- High performance stretch and shrink
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- Support rendering size of 32Kx32K
- 90/180/270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask
- Color space conversion between YUV and RGB
- High quality image scaling, using up to 9x9 separable filter
- Bit-Blit Formats
  - A1R5G5B5 (source/destination)
  - A4R4G4B4 (source/destination)
  - X1R5G5B5 (source/destination)
  - X4R4G4B4 (source/destination)
  - R5G6B5 (source/destination)
  - X8R8G8B8 (source/destination)
  - A8R8G8B8 (source/destination)
  - 8-bit color index (source only)
  - A8 (source/destination)
  - 1-bit monochrome (source only)
- Filter Blit Formats
  - A1R5G5B5 (source/destination)
  - A4R4G4B4 (source/destination)
  - A8R8G8B8 (source/destination)
  - R5G6B5 (source/destination)
  - X1R5G5B5 (source/destination)
  - X4R4G4B4 (source/destination)
  - X8R8G8B8 (source/destination)
  - YUV (source only):
    - NV12 (4:2:0, 2 planes)
    - NV16 (4:2:2, 2 planes)
    - UYVY (4:2:2, interleave)

- YUY2 (4:2:2, interleave)
- YV12 (4:2:0, 3 planes)
- 8-bit color index(source only)

### 9.1.6.2 2D Performance

- Geometry Rate: 26.6M Triangles/sec
- Pixel Rate: 256M pixels/sec

### 9.1.6.3 2D Software

API / Driver Support

- GDI/DirectDraw
- DirectFB
- X11 EXA

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

## 9.1.7 Vector Graphics Processing Unit (GPUVGv2)

### 9.1.7.1 Vector Graphics Features

Featureset Overview:

- Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves
- 16x Line Anti-aliasing
- OpenVG 1.1 support
- Vector Drawing:
  - Coordinate Systems and Transformations
  - Viewport Clipping, Scissoring and Alpha Masking
  - Paths and stroke generation
  - Image interpolation
  - Image Filters
  - Paint (gradient and pattern)
  - Blending

### 9.1.7.2 Vector Graphics Performance

- GPU-VG @ 533MHz
- Full OpenVG 1.1 Khronos Conformance
- 533 M pixels / sec raw performance (1 pixel / clock)

### 9.1.7.3 Vector Graphics Software

API / Driver Support

- OpenVG 1.1

Operating Systems

- Windows CE
- Linux Embedded and X11

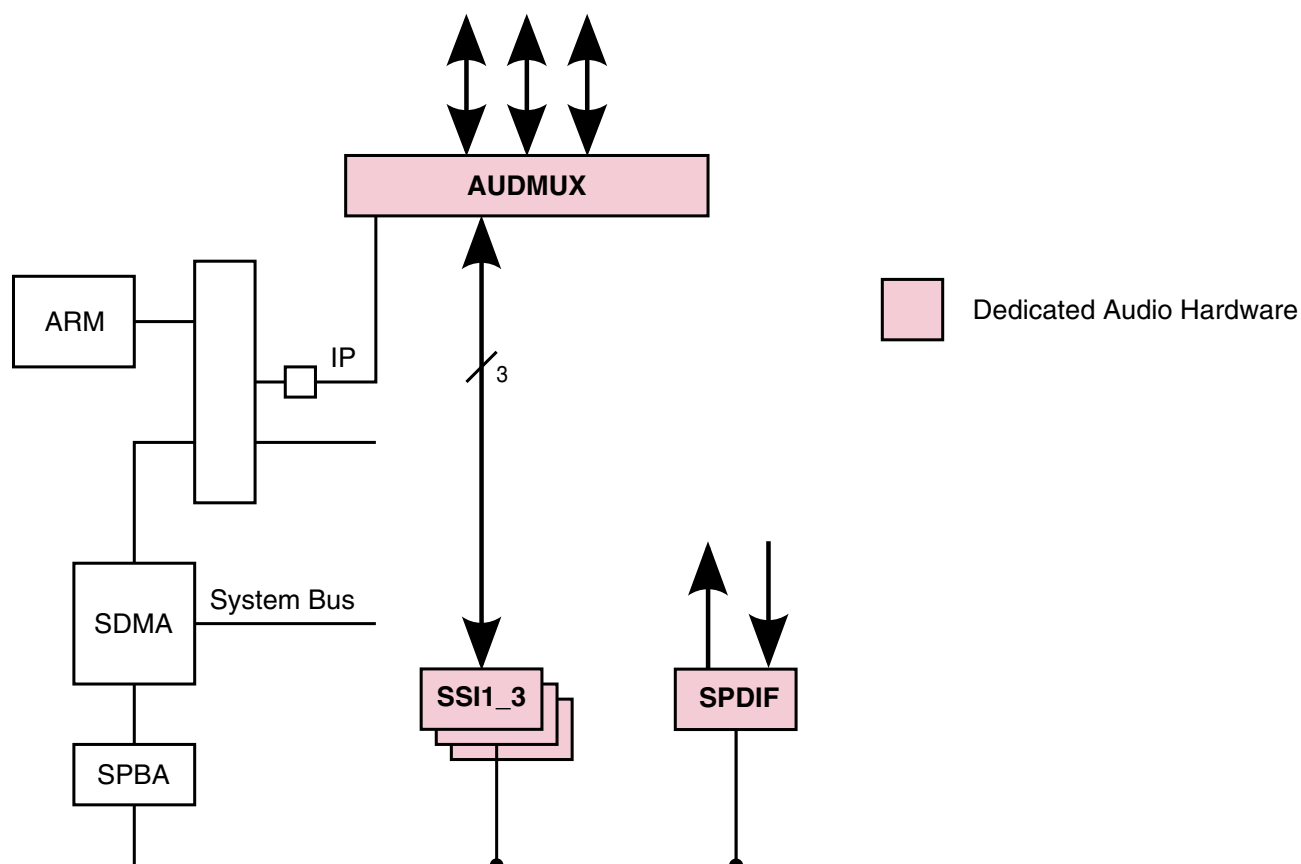

## 9.2 Audio subsystem

The audio subsystem consists of the following modules: SSI-1, SSI-2, SSI-3, AUDMUX, and SPDIF. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

[Audio subsystem module overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

### 9.2.1 Audio subsystem module overview

The following figure shows a high level block diagram of the audio subsystem.

**Figure 9-2. Audio subsystem block diagram**

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX handles data and clock signal routings to a particular SSI unit (SSI1, SS2, or SSI3) because SSI has no direct contact to the pin. AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

## 9.2.2 Synchronous Serial Interface (SSI)

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.

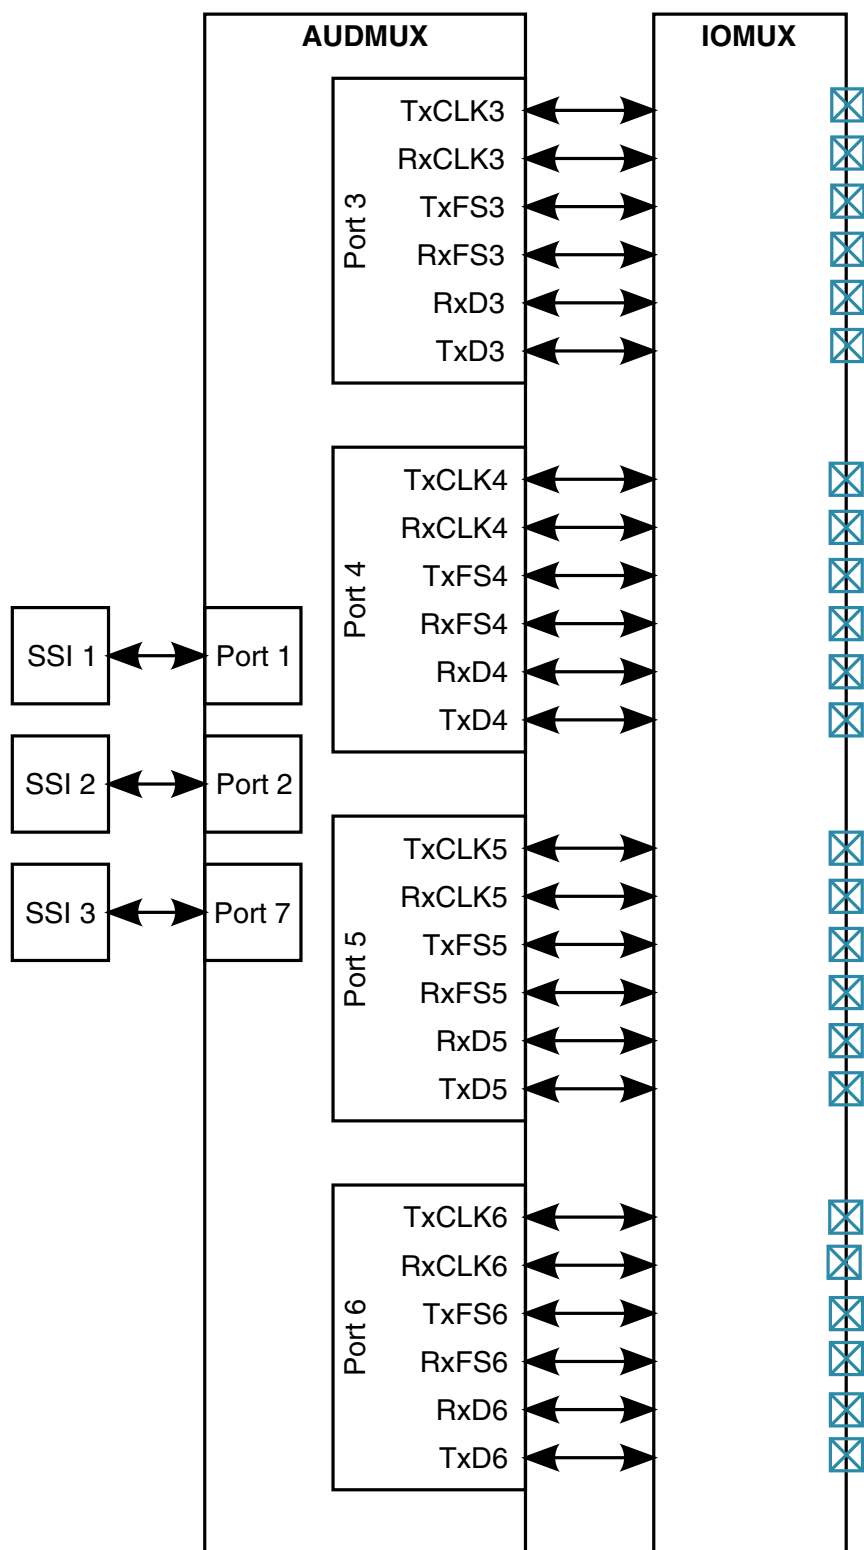

## 9.2.3 Digital Audio MUX (AUDMUX)

The Digital Audio Mux (AUDMUX) provides a programmable interconnect fabric for voice, audio, and synchronous data routing between host serial interfaces, such as SSI, and peripheral serial interfaces—that is, audio and voice codecs.

The AUDMUX includes two types of interfaces. Internal ports connect to the processor serial interfaces, and External ports connect to off-chip audio devices. A desired connectivity is achieved by configuring the appropriate host and peripheral ports.

The AUDMUX provides flexible, programmable routing of the on-chip serial interfaces to and from off-chip audio devices. The AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself.

The following figure illustrates how the AUDMUX is connected in the system.

☒ - IO PAD (more than one PAD is available for each signal, only one option shown above).

**Figure 9-3. AUDMUX System Block Diagram**  
i.MX 6SoloLife Applications Processor Reference Manual, Rev. 1, 04/2013

## 9.2.4 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. i.MX 6SoloLite provides one SPDIF transmitter with one output.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The , SSI's clock sources should provide a clock that is at least  $64 \times F_s$ , where  $F_s$  is the sampling frequency. The external clock source should provide at least  $128 \times F_s$ . Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example,  $128x$ ,  $256x$  or  $512x$ ). Also, clock frequency precision of 100ppm or better should be provided.

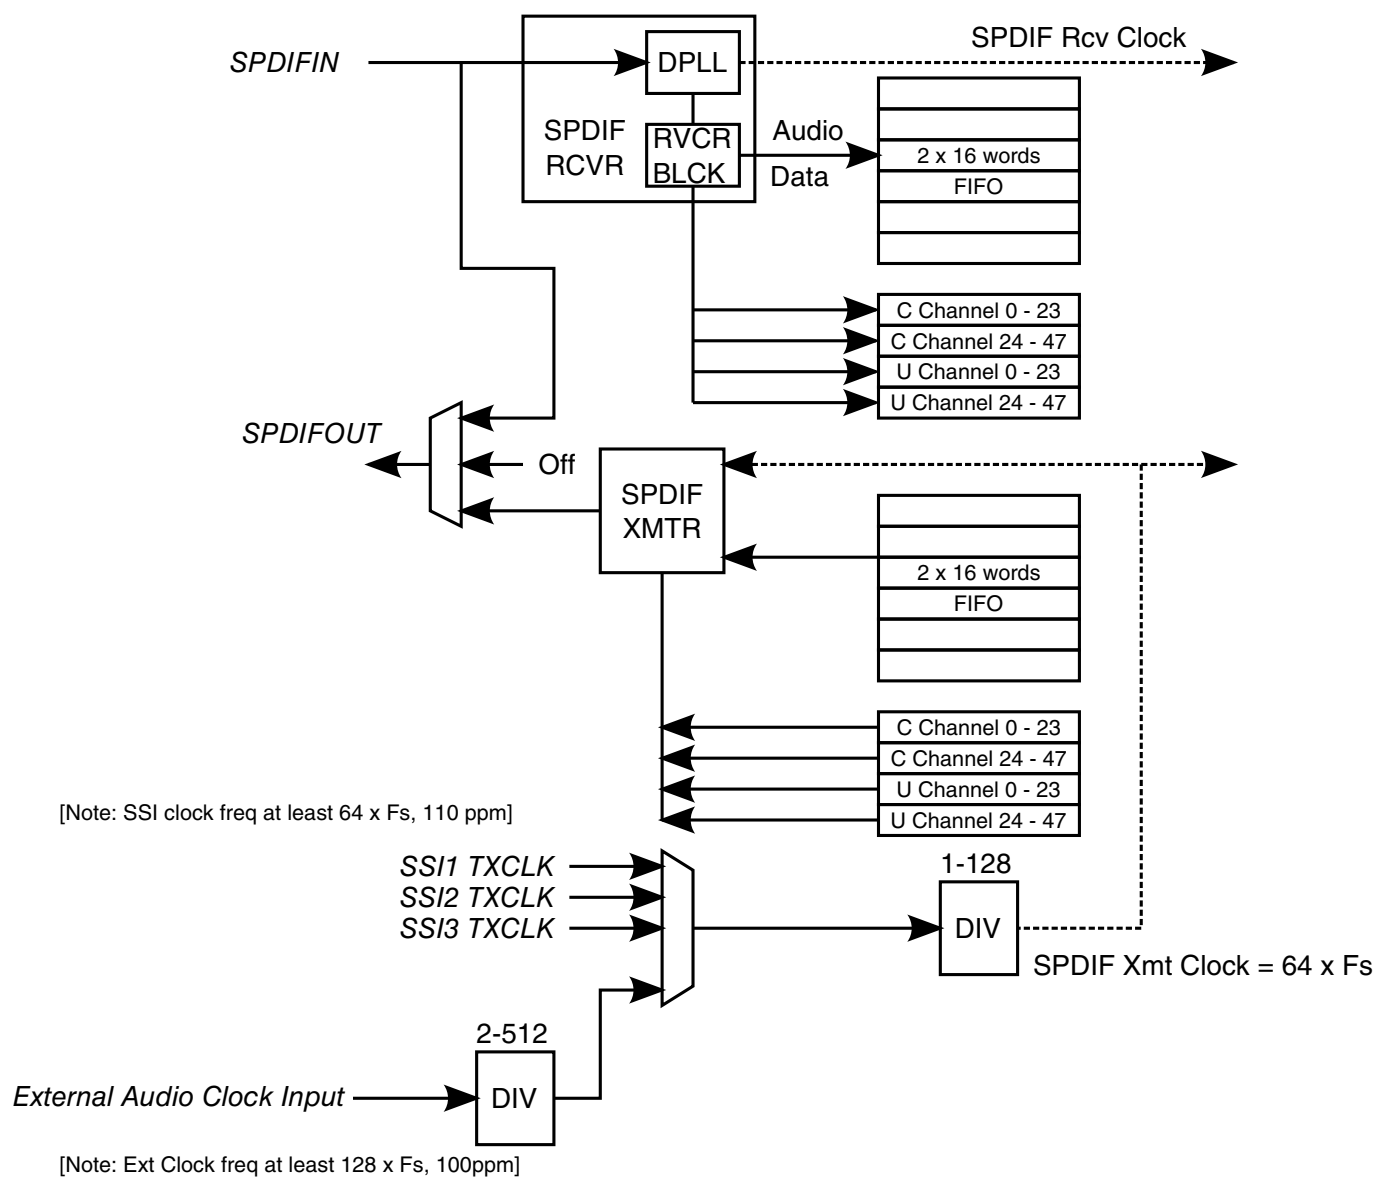

Figure 9-4. SPDIF Transceiver Clock Diagram

# Chapter 10

## Clock and Power Management

### 10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The device targets many applications where low power consumption, long battery life, always-on and instant-on capabilities, and no need for active cooling are paramount. For this reason, the design constantly focuses on reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility:

This introduction contains information about:

- Structural components of the power and clock management systems of the device
- Power, clock and thermal management techniques supported by the device

All the numerical values are typical or examples, for accurate values one should use the datasheet.

### 10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, the Clock and Power rails are considered managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of clock, power and thermal management system of device is presented on a figure below.

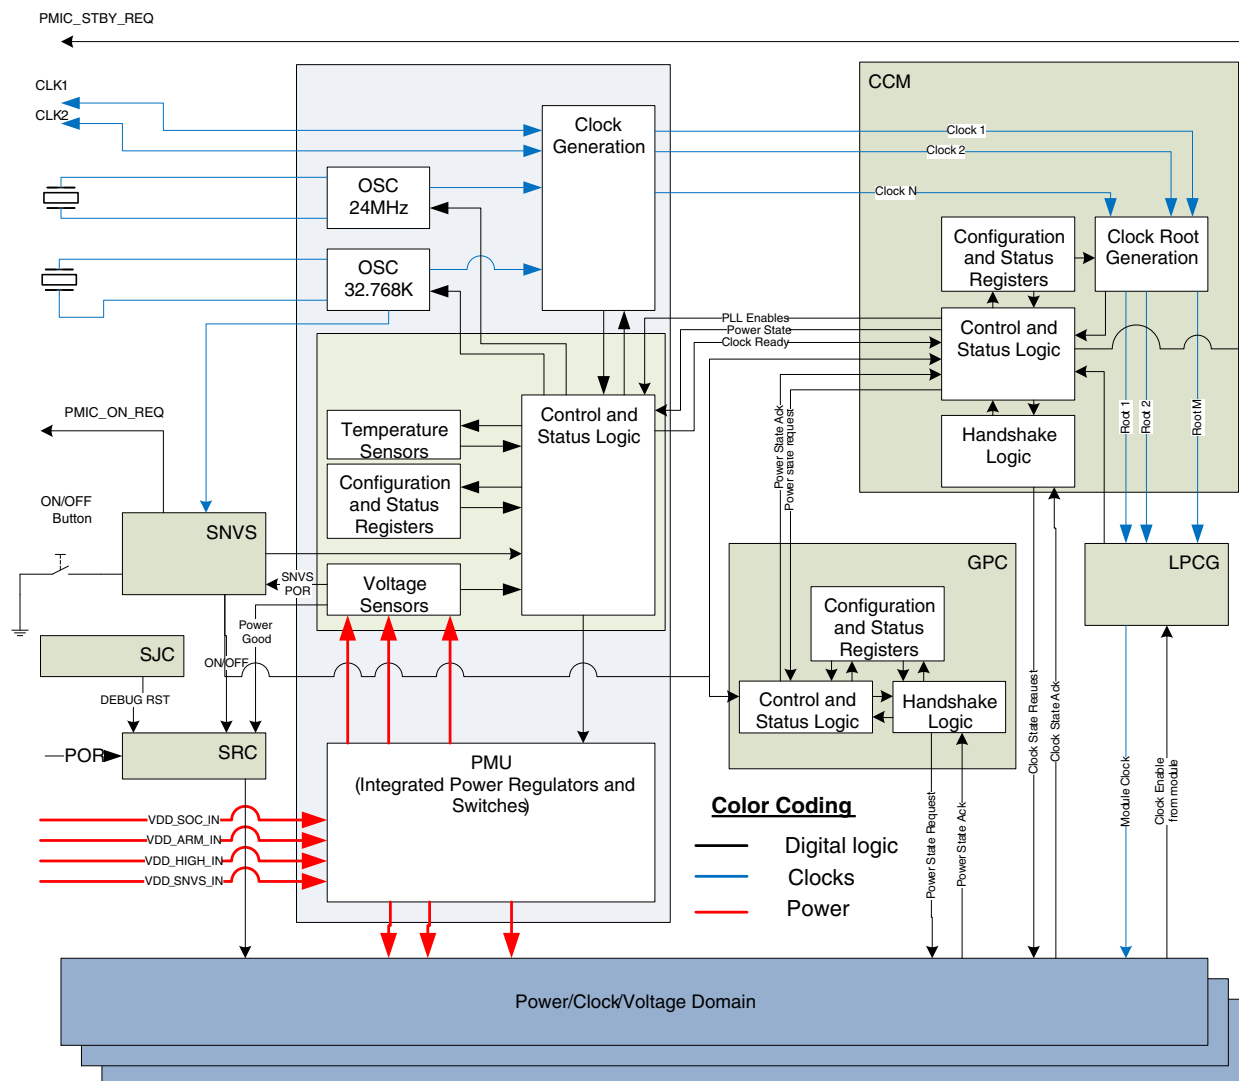

Figure 10-1. Power and clock management framework

## 10.2.1 Centralized components of clock generation and management

Centralized components of clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating.

- See [Clock Controller Module \(CCM\)](#) for information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

### 10.2.2 Centralized components of power generation, distribution and management

Centralized components of power generation, distribution and management sub-system are implemented in the following blocks:

- PMU (Integrated Power Management Unit). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- GPC (General Power Controller). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

### 10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

### 10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management defines the minimal managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

#### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

## **10.3 Clock Management**

### **10.3.1 Centralized components of clock management system**

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in figure below.

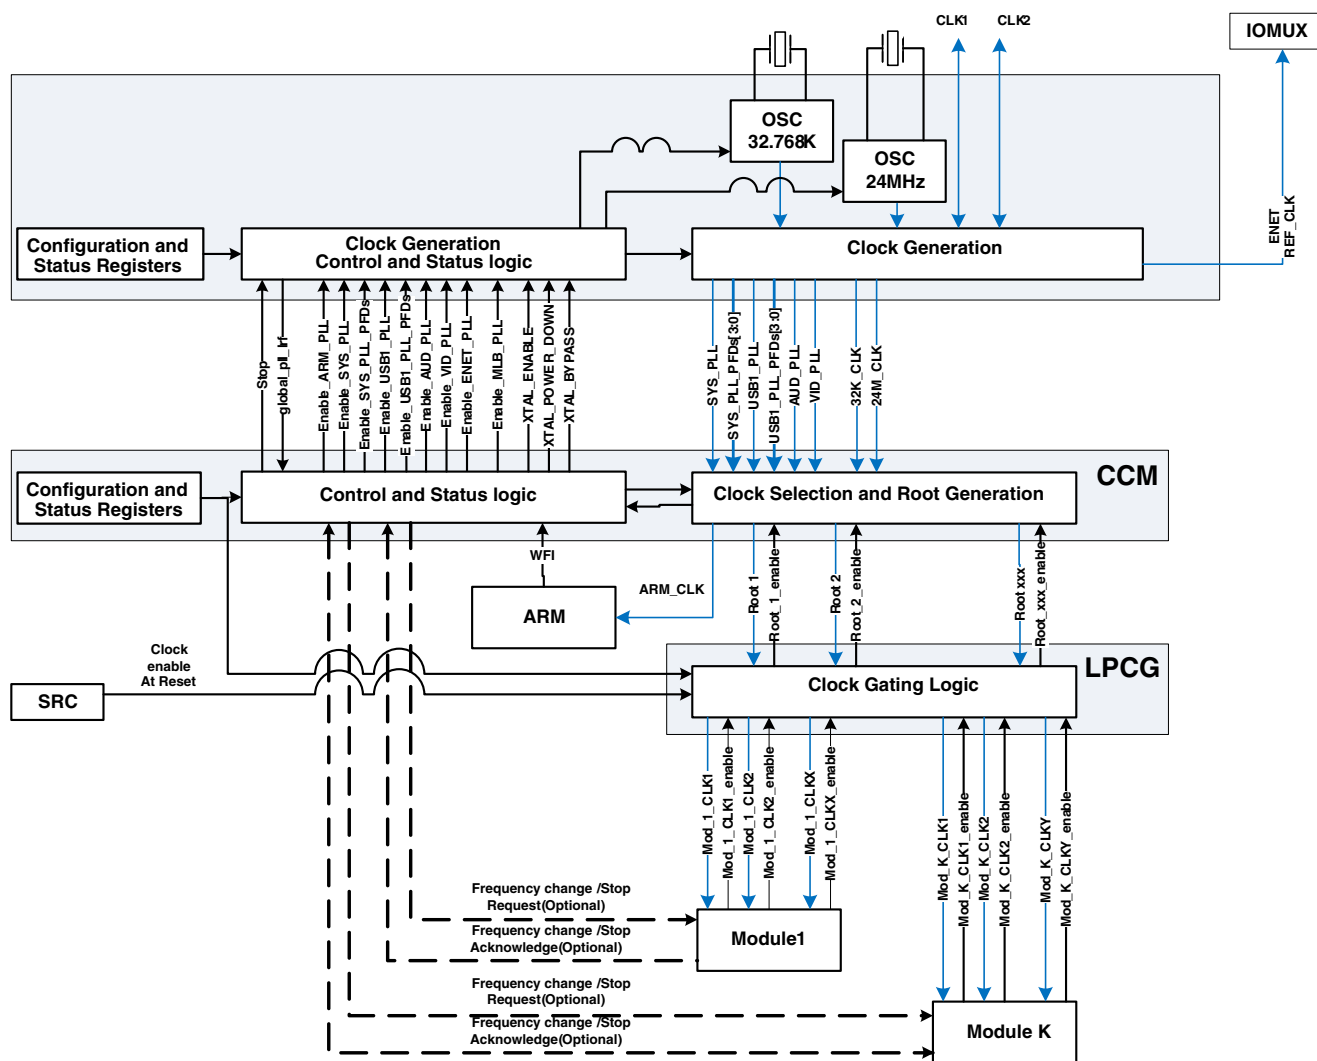

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

**Figure 10-3. Primary Clock Generation**

## 10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. Any of them may serve as an external clock input as well. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

There is also a lower-power RC oscillator available on-chip that can be used as an alternative to the crystal oscillator. Because it has accuracy limitations it is intended to be used mainly in conjunction with the low-power modes. For more information please contact a Freescale FAE for pertinent application notes.

### 10.3.2.2 LVDS I/O ports

There are two LVDS I/O ports used for clock generation. These two low jitter differential I/O ports are provided to input and output clocks. They can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or they can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

### 10.3.2.3 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{vco}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL

locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0GHz.
- PLL2 (also referred to as System\_PLL or 528\_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528MHz output frequency with 24MHz reference from XTALOSC. Besides the main output, this PLL drives three PFDs (PLL2\_PFD0...PLL2\_PFD2). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1\_PLL or 480\_PLL1) - PLL3 is used in conjunction with the first instance of USB PHY (USB0 PHY, also known as OTG PHY). This PLL drives four PFDs (PLL3\_PFD0...PLL3\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480MHz with a 24MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency.

- PLL6 (also referred to as ENET\_PLL) - This PLL implements a fixed  $20+(5/6)$  multiplier. With a 24MHz input, it has a VCO frequency of 500MHz. This PLL is used to generate:
  - 50 or 25 MHz for the external ethernet interface.
  - 125MHz for reduced gigabit ethernet interface.
  - 100MHz for general purposes.
- PLL7 (also referred to as USB2\_PLL or PLL2\_480) - This PLL provides clock exclusively to USB2 PHY (also known as HOST PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480MHz with a 24MHz oscillator.

### 10.3.2.3.1 General PLL Control and Status Functions

PLLs configuration and control functions are accessible via individual per PLL and PFDs and global configuration and status registers.

Reference input clock for any of the PLLs except the MLB PLL could be selected individually by the BYPASS\_CLK\_SRC field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.freescale.com](http://www.freescale.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### 10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Graceful changing of the DDR memory controller clock. See [MMDC handshake and Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

#### NOTE

Note: on-the-fly frequency changing for synchronous interfaces like serial audio interfaces (SSI, ESAI), Audio Sample Rate Converter (ASRC), or general purpose serial interfaces (UART, CAN) in general causes synchronization loss and should not be done.

### 10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from four sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

### 10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the system.

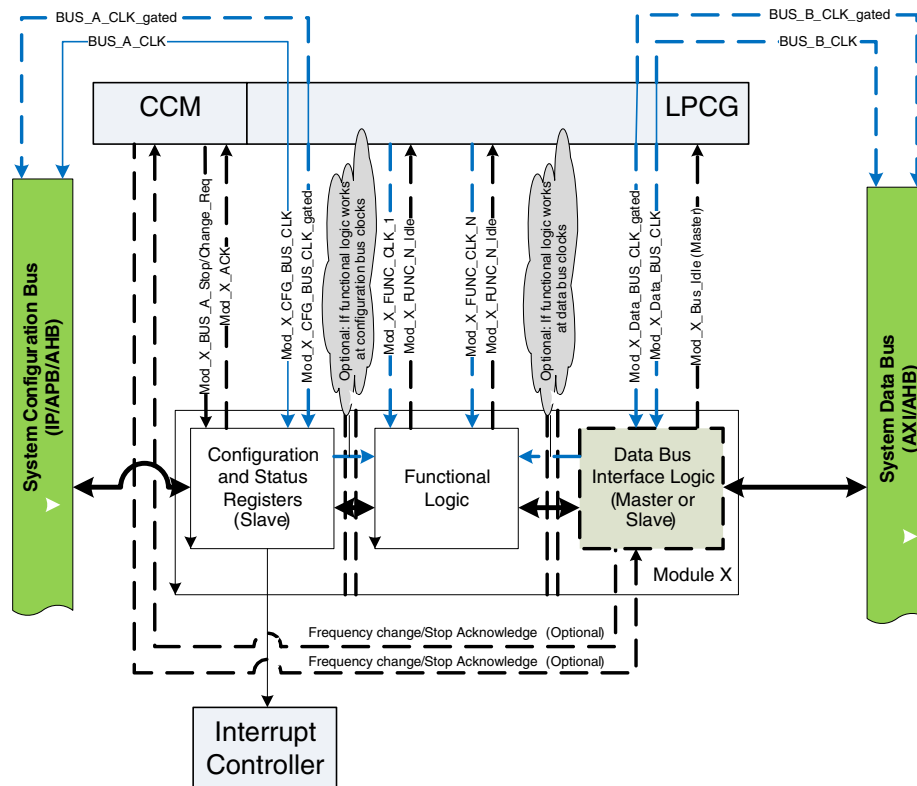

Figure 10-4. Clock interface of the functional module in system

### 10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### 10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

### 10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of modules supporting master clock protocol are GPU2D, VDOA and USDHC. Please see details in chapters describing these modules and in

### 10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are product="mx6dq mx6sdl">CAN, EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### **10.3.3.3 Clock Domain(s)**

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

Examples of clock domains are: Main AXI bus clock domain, GPU2D clock domain, etc.

### **10.3.3.4 Domain level clock management**

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### **10.3.3.5 Domain dependencies**

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## **10.4 Power management**

### 10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks. A high level block diagram of the power management system in the SoC environment is shown in the figure below.

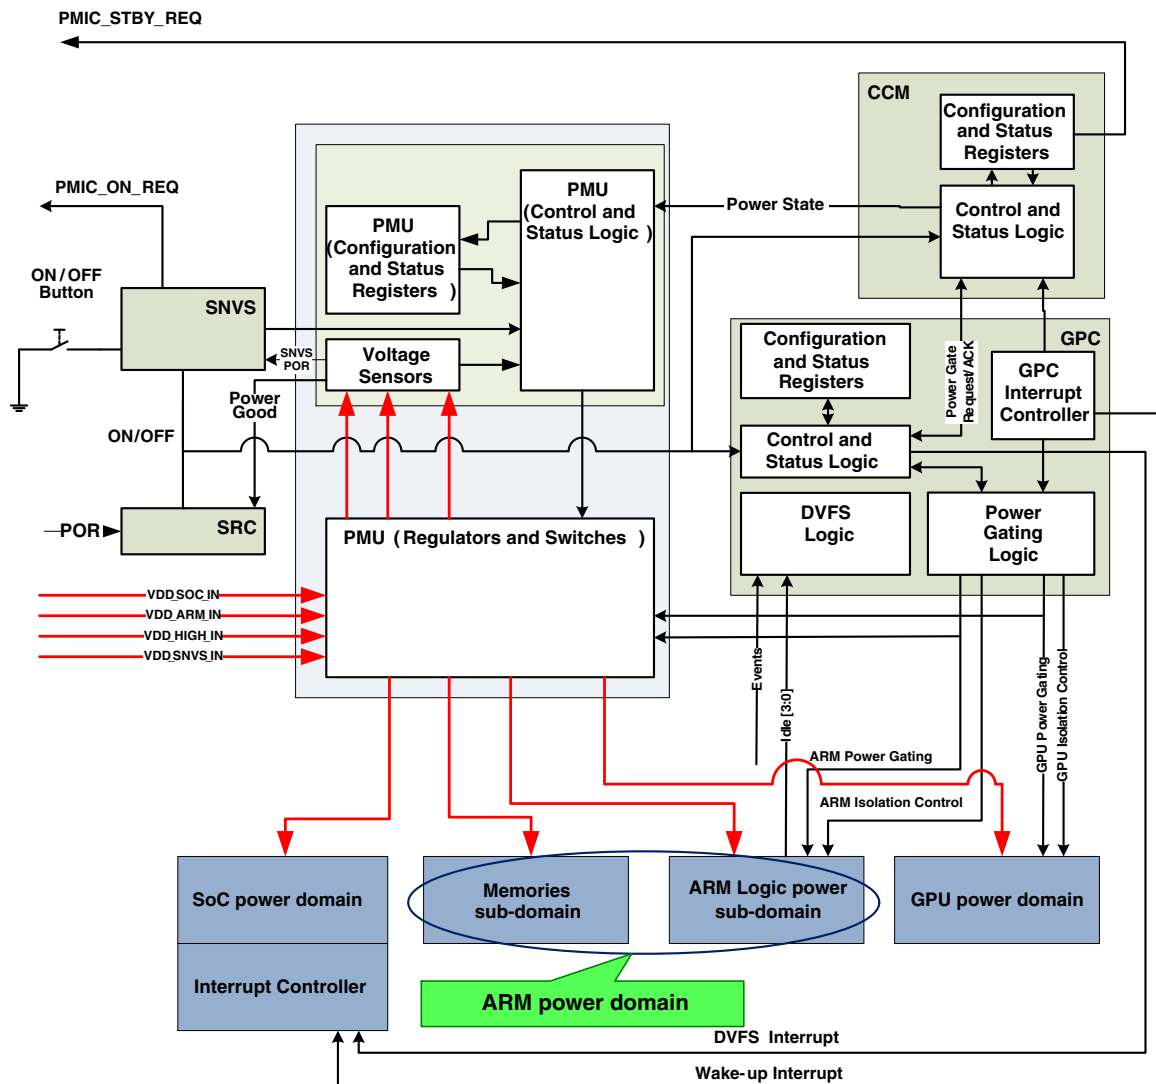

Figure 10-5. Power Management System

#### 10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator
- Reverse well biasing

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

### 10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO\_ARM, LDO\_PU, and LDO\_SOC. These regulators provide power to the ARM\_Core power domain, the combined VPU and GPU power domain, and the rest of the SoC logic (except always-ON SNVS domain).

#### NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- Internal Bypass - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that some time is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- External Bypass - The input and output of the regulator are shorted externally to the SoC. If operating in this configuration, enable the internal bypass early in the startup sequence before attempting high frequency/high power operation. Be aware that internal power gating is not available in this mode.
- Power Gate - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage

of the power FET balances with the leakage of the load. Power gating is applicable to ARM and PU power domains.

- Analog regulation mode - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU\\_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU\\_REG\\_CORE\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

In highly power-optimized systems, it is possible to use multiple external DCDC buck converters and bypass internal LDO for high power domains. The obvious trade-off is in the increased complexity of the external power supply components and the associated increase in the BoM and board design complexity.

#### 10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24MHz oscillator.
- LDO\_2P5 - The LDO\_2P5 linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not

programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, special I/Os (LVDS I/O, DDR I/O), and other analog and mix signal components integrated into the SoC.

#### 10.4.1.1.3 USB LDO

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

#### 10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

#### 10.4.1.1.5 Reverse well biasing

The reverse well biasing module on the SoC consists of a self-clocked/self-regulating charge-pump circuit, used to generate a negative bias voltage for the floating PWELL, and a low-power regulator. The low-power regulator is used to generate a positive bias voltage for the NWELL of the digital logic cells on the SOC power domain. Static leakage reduction can be achieved during SoC low-power modes through the use of these reverse well bias voltages. Please refer to the CCM\_CLPCR register in [CCM Memory Map/Register Definition](#) and PMU\_MISC0 in [PMU Memory Map/Register Definition](#) for details about well bias control and [Static](#) " for functional description of the reverse well biasing.

#### 10.4.1.2 GPC - General Power Controller

The GPC block provides hardware assistance to Dynamic Voltage Frequency Scaling (DVFS) and power gating, and includes the sub-blocks listed here.

- **DVFS load tracking block** - This block allows hardware tracking on the core load and generates an interrupt when a frequency change is requested. It does not generate any request for voltage and/or frequency changes made by a hardware signal. The frequency/voltage changing process requires interaction with the CCM block, as well as either the integrated PMU modules or the external programmable regulator. This process should be completed by either the CPU interrupt routine or a DMA transaction.
- **Power Gating Controller (PGC)** - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and the combined GPU/VPU power domain.
- **Wake-up interrupt controller** - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 128 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

### 10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

### 10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

Figure below shows the power domain interface in the system

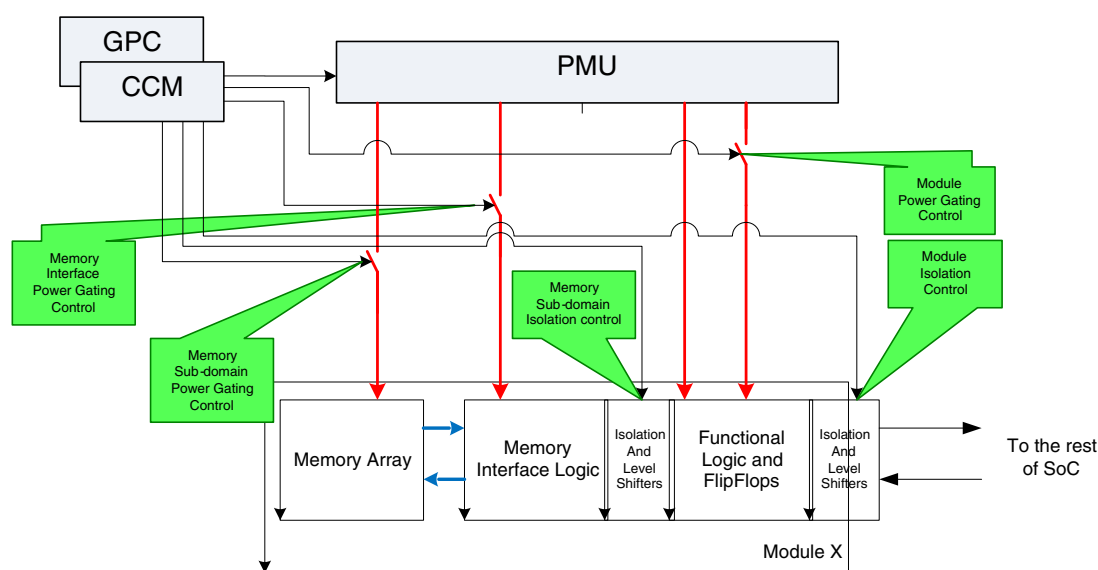

Figure 10-6. Power domain interface in system

#### 10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated

power supply or from an external controllable regulator, preferably high efficiency DCDC converter.

- ARM Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional, non-DVFS mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- PU domain - This domain contains the GPU2D and OpenVG engines.
- Display domain - This domain contains the display elements of the chip.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC including most of the peripherals. It is supplied by an internal regulator.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- ARM memories - Power gating only.
- PU - Power gating only.
- Display - Power gating only.

See table below for details of the i.MX 6Solo lite system power domains layout and dependencies.

#### **10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating**

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex -A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the

logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.

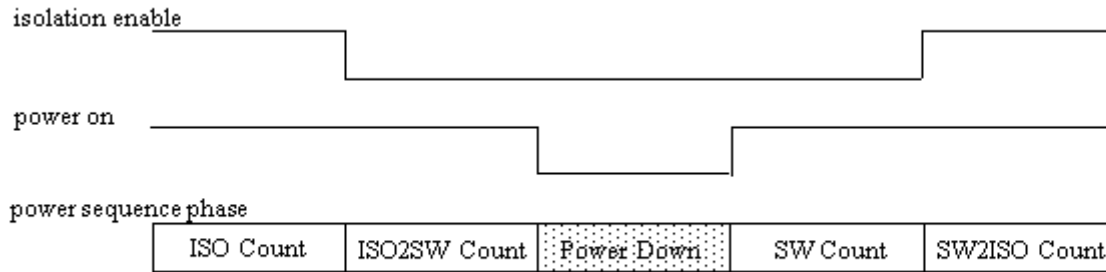

- Cortex-A9 Core L1 memories - No retention. The L1 memories have a dedicated supply on the package (VDD\_CACHE\_CAP) which should be connected to the Cortex-A9 Core Platform supply. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A9 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies.
- PU (GPU2D and OpenVG): These modules can be power gated (together) independently of Cortex-A9 power gating, because it resides on a separate power domain. State retention is not supported for PU logic nor for their internal memories.
- SoC - hardware state-retention in Standby mode. Reverse Well Biasing is applicable for this domain.
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

#### 10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

##### 10.4.1.4.3.1 Cortex-A9 Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
  - Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
  - Cortex-A9 Core Platform should execute a "WFI" instruction.

**Figure 10-7. Cortex-A9 Core Platform isolation and power on switch flow**

#### 10.4.1.4.3.2 GPU2D

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the GPU2D clocks.
2. Configure the GPC/PGC GPU registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the GPU2D logic from the rest of the SoC logic:

Configure the GPC/PGC PGC\_GPU\_PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the PU isolation.

Configure the GPC/PGC PGC\_GPU\_PUPSCR Register SW2ISO bits. These bits determine the power-up request to the PU isolation disabling.

Configure the GPC PGC PGC\_GPU\_CTRL PCR bit to allow the power down of the platform.

1. Software should wait PDNSCR x IPG\_CLK cycles before next step which is powering down the PU
2. Configure the PMU PMU\_REG\_CORE ([PMU Memory Map/Register Definition](#)) to gate off the PU regulator. The exit sequence should be in the reversed order i.e. restore power first and enable the clocks last.

When powering up the PU domain a delay may need to be added between enabling the PU LDO and disabling the PU isolation.

**Figure 10-8. GPU and Display isolation and power on switch flow**

## 10.4.1.4.3 SoC

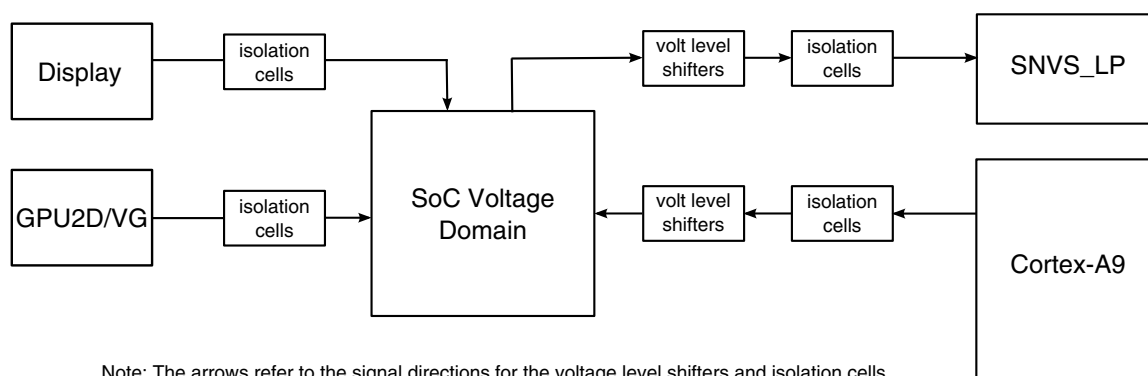

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24MHz XTAL for wake-up.
- Enable reverse well biasing by configuring the CCM\_CLPCR[WB\_PER\_AT\_LPM] bit ([CCM Memory Map/Register Definition](#)).
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply, configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the RESET\_IN\_B pad.

## 10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- GPU2D and Display - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS\_LP - Different from the 2 cases above the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP. (such as the real-time clock) The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

**Figure 10-9. Isolation cells and Voltage level shifters placing**

### 10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A9 Core Platform including L1 cache - Scalable voltage in both dynamic and static scenarios
- SoC and PU - Scalable voltage only in static scenarios
- ANALOG components including LVDS and PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 10.4.1.6 Voltage domain management

#### 10.4.1.6.1 Dynamic

##### 10.4.1.6.1.1 DVFS

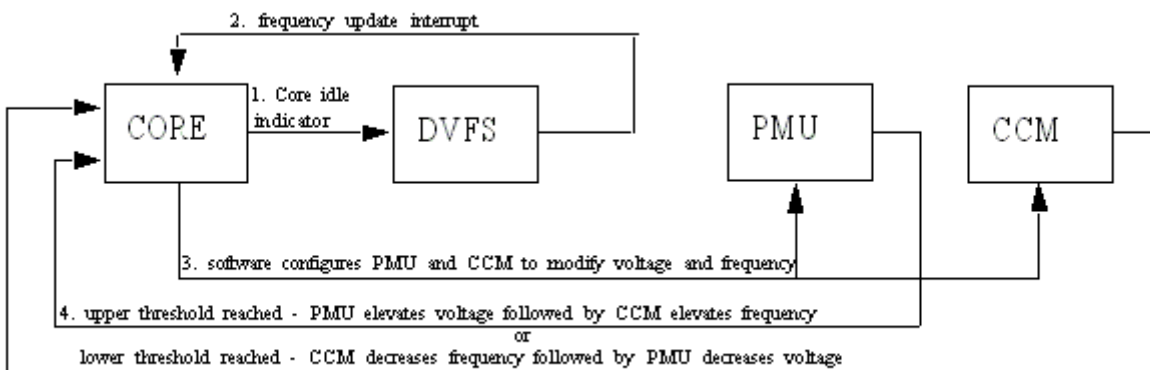

Dynamic Voltage and Frequency Scaling (DVFS) is a well-known technique to reduce power consumption in mobile devices. In order to improve power saving efficiency, DVFS is applied on the ARM core voltage domain.

In this scenario the Dynamic Voltage and Frequency Scaling (DVFS) block is used. More details can be found in [DVFS-CORE \(DVFS\)](#). The DVFS block can monitor separately the IDLE indication of each of the Cortex-A9 Cores. The DVFS performs the following:

- Simple, non-overlapping averaging providing a level-based average index of the tracked CPU load
- Sums the CPU load and the load detected from additional load indicators weighted according to software configurations
- Calculates an exponential moving average of the tracked load
- Provides up, down and "panic" threshold comparators and counters for generating interrupts to the Cortex-A9 Core Platform
- Frequency pattern generator is able to manage the frequency update requests periodically

The DVFS interrupts are then forwarded to the Cortex-A9 Core Platform. The Cortex-A9 Core Platform reacts according to the DVFS interrupt types. The following are 2 examples for handling different DVFS interrupt types:

- Upper threshold is reached, meaning that the Core is heavily loaded and the core frequency needs to be increased according to the following flow:
- Configure PMU to raise the core voltage
- Wait until the voltage is stable
- Configure CCM to raise the frequency.
- Lower threshold is reached, meaning that the Core is "IDLE" most of the time and the core frequency can be decreased according to the following flow:
- Configure CCM to reduce the frequency.
- Configure PMU to lower the core voltage.

**Figure 10-10. High Level DVFS working flow**

#### NOTE

PMU can not be used to change the voltage in case the LDO is bypassed.

#### 10.4.1.6.1.2 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and PU voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

#### 10.4.1.6.2 Static

##### 10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains
- Reverse well-biasing in STOP, WAIT, or Deep Sleep Mode (DSM) modes

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage and reverse well bias to the SoC:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Cortex-A9 Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode
- After that, the reverse well bias will be applied automatically (if enabled) with appropriate delay. Please refer to CCM\_CLPCR and CCM\_CCR Registers in CCM for further information on reverse bias enabling and counters configuration.

#### 10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitations should be taken into account:

- In dynamic scenarios the SoC and PU voltage supplies should not differ
- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more the 50mV.

The above limitations are also mentioned in datasheet.

#### 10.4.1.6.4 IO voltage

#### 10.4.1.7 system domains layout

The following table describes the different aimed power modes for :

#### NOTE

Wakeup time is the hardware perspective, and doesn't reflect the time it takes software to resume drivers and perform system operations.

**Table 10-1. Aimed power modes**

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
RUN	Power supplies are on, all clocks are on.	N/A	N/A	All
WAIT	Power supplies are on. ARM executes WFI command, Option to gate off clocks for specific modules based on programmable bits.	Based on interrupt from any module	Immediate (ARM exit WFI)	IDLE process of operating system.
STOP	Power supplies are on. ARM executes WFI command. GPU is in power gating PLLs are off, hence all system clocks are off.	Based on interrupt from modules that can track operation with low frequency clock- like Keypad press, GPIO, Timer, etc.	~50us	Suspend state of operating system - system is on but is waiting for operation.

*Table continues on the next page...*

**Table 10-1. Aimed power modes (continued)**

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
Standby	<ul style="list-style-type: none"> <li>- PLLs disabled</li> <li>- Low voltage could be applied to ARM and SoC power inputs</li> <li>- Chip regulator bypass if reduce supply voltage,</li> <li>- Well Bias could be activated</li> <li>- CPU regulator disabled for power gating</li> <li>- PU regulator is disabled in software</li> <li>- xtal enabled</li> </ul>	Same as above	~220 us	Low power standby mode with limited reaction on external events
Deep Sleep	Same as above but with OSC24M disabled	Interrupts from modules those could generate asynchronous interrupts (Keypad, GPIO, SNVS)	~1400us	
SRTC	Only SNVS domain and OSC32K keep alive	<p>SRTC security alert / SRTC timer expire.</p> <p>Based on each one of those, SRTC module will generate request to PMIC to perform POR sequence and walk-up the system. The system will go through boot process.</p> <p>PMIC can also receive press on "ON" button to walk-up the system. This should be connected directly to PMIC.</p>	<p>~1700us to WARM boot</p> <p>COLD boot, depends on boot procedure and boot device</p>	

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU\_MISC0[STOP\_MODE\_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 10-2. STOP mode configuration**

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_pu	bypassed if not power gated.	bypassed if not power gated.
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLs	off	off
OSC24M	off	Controlled by CCM configuration
LVDS clock in/out CLK1 and CLK2	off	off

## 10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM A9) for preserving memory contents and device state in low-power modes
- Dynamic Voltage and Frequency Scaling (DVFS) support for the ARM A9 processor cluster
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

### 10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 10-3. Power saving design/architecture and power saving techniques**

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
Cortex-A9 Core Platform DVFS	√		
Cortex-A9 Core Platform SRPG (Software)		√	
Cortex-A9 Core Platform Power Gating		√	
GPU2D Power Gating	√	√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (SW)			√
Architecture: L2 cache, Video / Audio / Graphics acceleration	√		
Architecture: USB, LVDS integration			√
Low Power DDR: LPDDR2, LV-DDR3			√

### 10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain and the GPU domain, as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 10.4.2.3 Peripheral Power management

#### 10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

#### NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency from 528Mhz to 400MHz or below may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

#### **10.4.2.3.2 Video-Graphics system power management**

#### **10.4.2.3.3 IO power reduction**

SW should configure IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible, specifically RGMII segment
- Disable all unused LVDS pads (ANALOG, LDB)

### **10.4.3 Examples of External Power Supply Interfacing in the i.MX 6SoloLite based systems**

This section presents the examples of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented below. This scenario minimizes BoM and board design complexity.

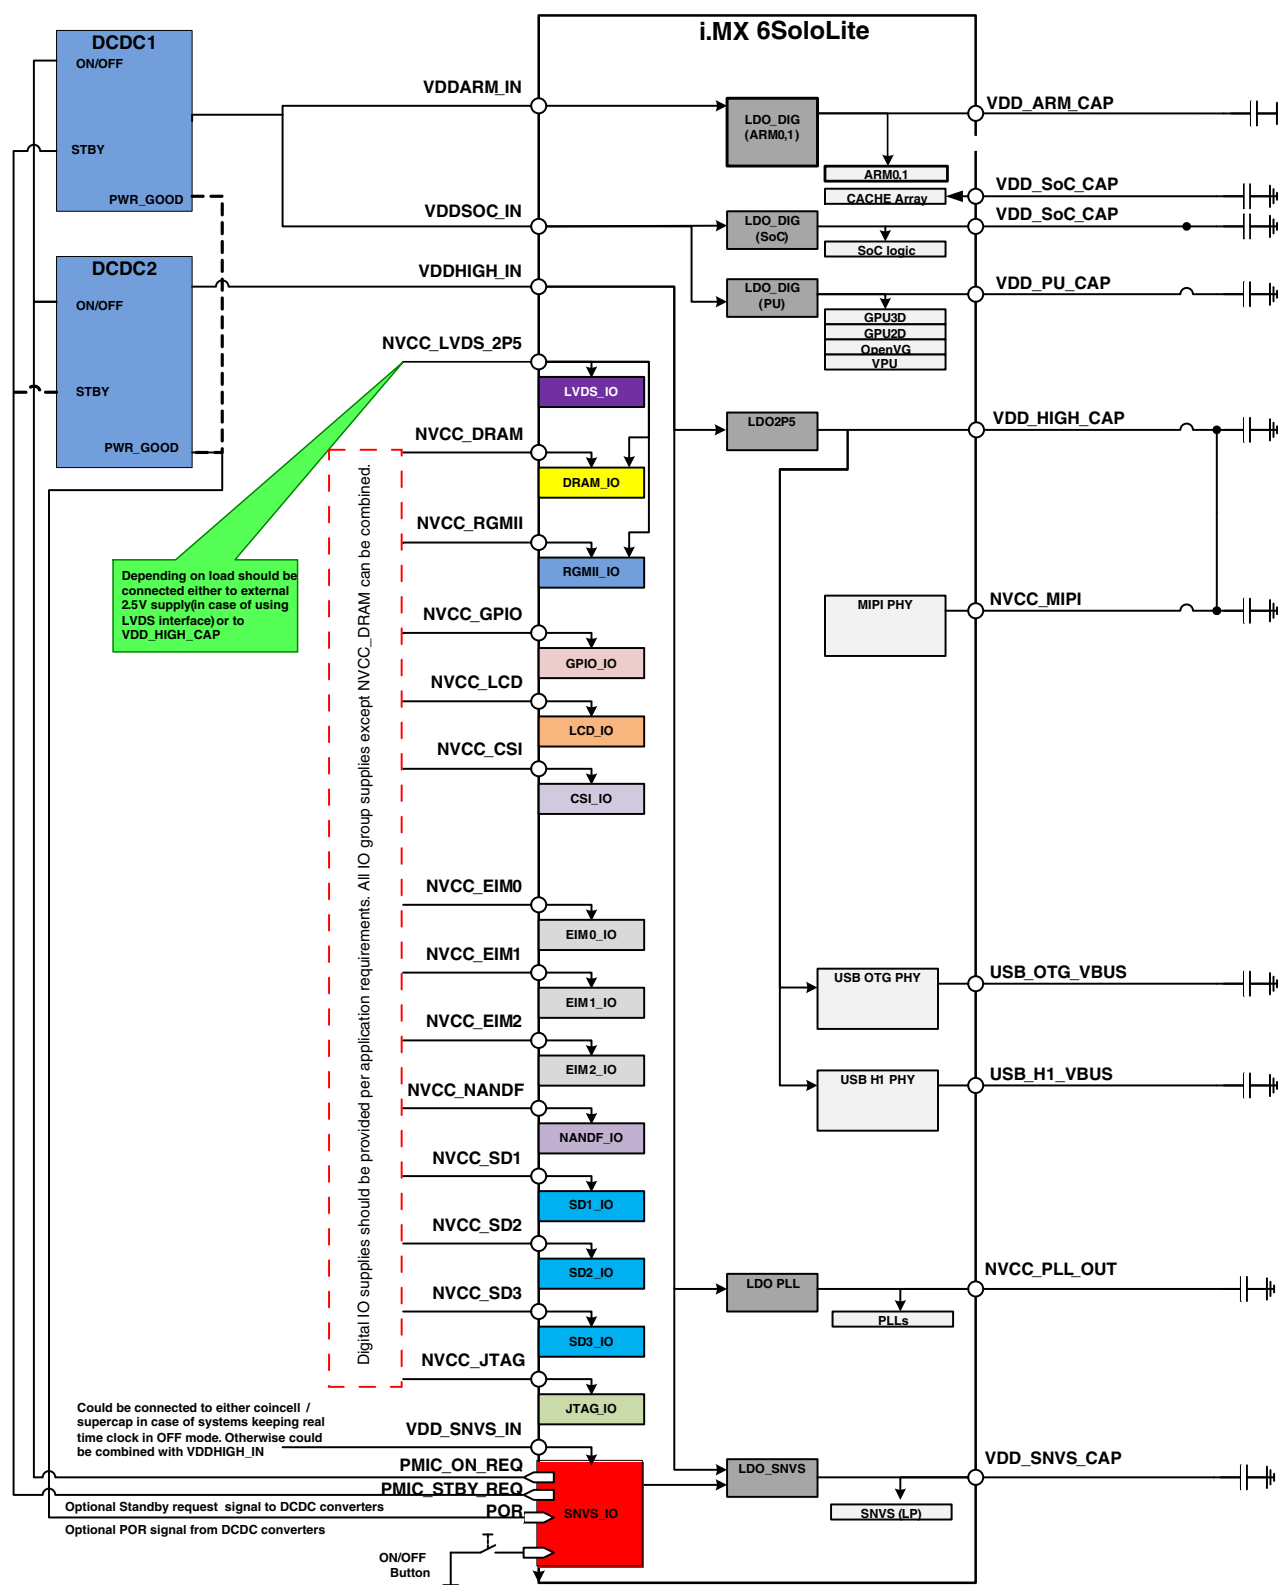

Figure 10-11. Supplying i.MX 6SoloLite power using integrated PMU

The scenario based on external programmable regulators is presented below: This scenario could be used in highly power optimized systems.

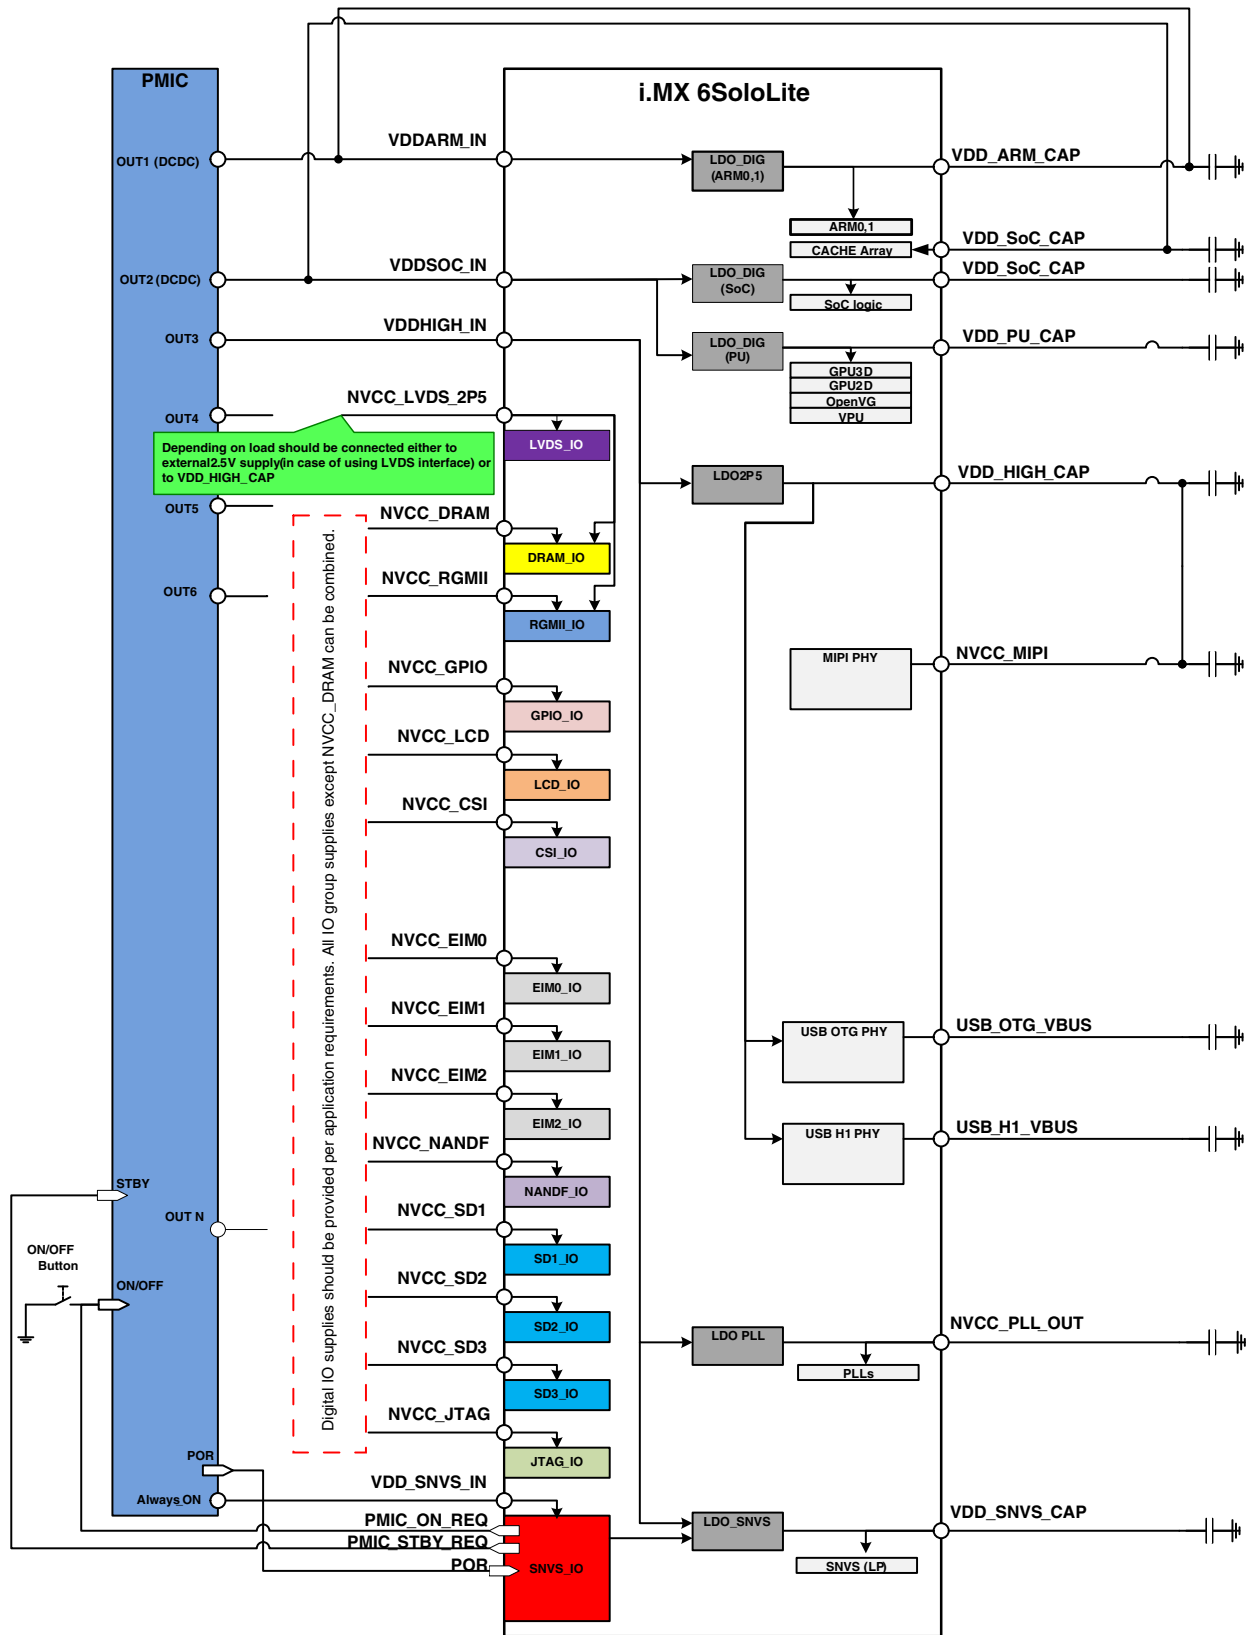

Figure 10-12. Supplying i.MX 6SoloLite Power Using External Programmable PMIC

## 10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The button is used to power On and Off the SoC using an always-on (e.g., coincell battery-backed) power domain.

- When the chip main power supply is Off, a button press greater in duration than 750 ms asserts an output signal to request power from a power IC to power up the SoC.
- When the chip main power supply is On, a button press between 750 ms and 5 seconds will send an interrupt to the core to request that software bring down the SoC safely. Software may respond to the interrupt by saving the processor state and then setting a control bit that requests to the power IC the removal of the main power supply.
- Button presses greater than 5 seconds, when the SoC is powered, results in a direct hardware power down request signal to the power IC without providing a software interrupt first. This long button press initiates a hardware-enforced mode which is applicable when software is unable to power Off the device.

The button is connected to input RESET\_IN\_B and the power IC is connected the chip output PMIC\_ON\_REQ. The chip must have TEST\_MODE deasserted. An always-On supply (e.g. coincell) is needed in the system for this feature.

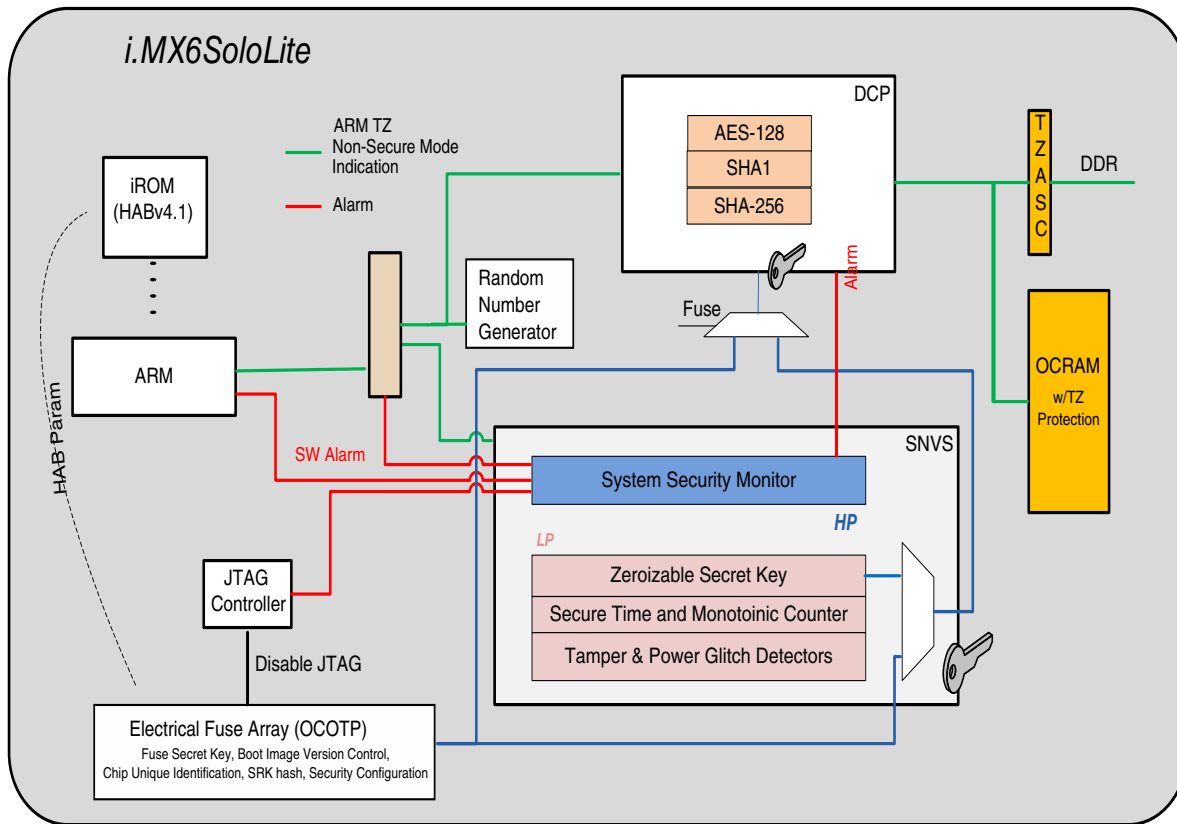

# Chapter 11

## System Security

### 11.1 Overview

Security is a common requirement for platforms built using the i.MX 6SoloLite, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

The following figure shows a simplified diagram of the security subsystem.

**Figure 11-1. Security subsystem (simplified)**

For the platform designer to meet the requirements for each market, the i.MX 6SoloLite incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the i.MX 6SoloLite security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the i.MX 6SoloLite includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the i.MX 6SoloLite security components.

- TrustZone (TZ) Architecture in the ARM Cortex A9 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OTCRAM) secure region protection using OTCRAM controller.
- High Assurance Boot (HAB) feature in the System Boot
- Data co-processor (DCP) with SHA-1/SHA-256 hashing algorithms, and AES encryption algorithm with device unique secret key for secure off-chip storage.
- Random number generator (RNGB)

- Secure Non Volatile Storage (SNVS)
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual*.

## 11.2 Central Security Unit (CSU)

### 11.2.1 CSU Overview

Security is increasingly important for connected devices such as smart phones, tablets, and integrated media players. Instances of hackers and pirates breaking into portable devices stealing private information and copyright content are now commonplace. As such, an embedded trust architecture is an important feature for many new products. To address security risks and to provide an extensible platform to meet stringent security requirements, this processor incorporates a number of advanced security hardware blocks and architectural features. The Central Security Unit (CSU) is one of those hardware blocks.

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

### 11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

### 11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers, including the command sequence file (CSF) processed by the High Assurance Boot (HAB) or a HABauthenticated image which executes after the boot ROM.

#### 11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual (see System Security Overview section).

**Table 11-1. Permission Access Table**

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

## 11.3 Secure Non-Volatile Storage (SNVS)

### 11.3.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows DCP to use special cryptographic keys to decrypt long-term secrets such as public keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event and denies the use of the special cryptographic keys mentioned above. The SNVS also includes a non-security-related real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key stored in fuses
- Tamper detection circuits that detect JTAG scan events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off

- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

### 11.3.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to help protect the target system “box” against unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD\_SNVS\_IN).

An always-ON power supply (coin cell) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- May activate security related hardware (e.g. erasure of the Zeroizable Master Key and secure memory contents)

## 11.4 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides a hardware acceleration for cryptographic algorithms. The features of DCP are:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- Key selection from SNVS, DCP internal key storage or general memory
- Internal Memory for storage of up to four AES-128 keys. Once a key is written to a key slot it may only be read by the DCP AES-128 engine.
- IP slave interface
- DMA

## 11.5 High Assurance Boot (HAB)

>HAB, which is the high assurance boot feature in the system boot ROM, protects the platform from executing unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform. Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

## 11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

## Chapter 12

# ARM Cortex A9 MPCore Platform (ARM)

### 12.1 Overview

The Cortex-A9 Core Platform consists of an ARM<sup>®</sup>Cortex<sup>®</sup>-A9 MPCore processor, which includes a Neon co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 256 KB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a 2 x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

### 12.2 External Signals

The following table describes the external signals of ARM:

**Table 12-1. ARM External Signals**

Signal	Description	Pad	Mode	Direction
ARM_EVENTI	Input event signal	EPDC_PWRSTAT	ALT4	I
ARM_EVENTO	Output event signal	EPDC_PWRWAKEUP	ALT4	O
ARM_TRACE00	Trace signal	LCD_DAT0	ALT6	O

*Table continues on the next page...*

**Table 12-1. ARM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
ARM_TRACE01	Trace signal	LCD_DAT1	ALT6	O
ARM_TRACE02	Trace signal	LCD_DAT2	ALT6	O
ARM_TRACE03	Trace signal	LCD_DAT3	ALT6	O
ARM_TRACE04	Trace signal	LCD_DAT4	ALT6	O
ARM_TRACE05	Trace signal	LCD_DAT5	ALT6	O
ARM_TRACE06	Trace signal	LCD_DAT6	ALT6	O
ARM_TRACE07	Trace signal	LCD_DAT7	ALT6	O
ARM_TRACE08	Trace signal	LCD_DAT8	ALT6	O
ARM_TRACE09	Trace signal	LCD_DAT9	ALT6	O
ARM_TRACE10	Trace signal	LCD_DAT10	ALT6	O
ARM_TRACE11	Trace signal	LCD_DAT11	ALT6	O
ARM_TRACE12	Trace signal	LCD_DAT12	ALT6	O
ARM_TRACE13	Trace signal	LCD_DAT13	ALT6	O
ARM_TRACE14	Trace signal	LCD_DAT14	ALT6	O
ARM_TRACE15	Trace signal	LCD_DAT15	ALT6	O
ARM_TRACE16	Trace signal	LCD_DAT16	ALT6	O
ARM_TRACE17	Trace signal	LCD_DAT17	ALT6	O
ARM_TRACE18	Trace signal	LCD_DAT18	ALT6	O
ARM_TRACE19	Trace signal	LCD_DAT19	ALT6	O
ARM_TRACE20	Trace signal	LCD_DAT20	ALT6	O
ARM_TRACE21	Trace signal	LCD_DAT21	ALT6	O
ARM_TRACE22	Trace signal	LCD_DAT22	ALT6	O
ARM_TRACE23	Trace signal	LCD_DAT23	ALT6	O
ARM_TRACE24	Trace signal	FEC_RXD0	ALT6	O
ARM_TRACE25	Trace signal	FEC_RX_ER	ALT6	O
ARM_TRACE26	Trace signal	FEC_MDIO	ALT6	O
ARM_TRACE27	Trace signal	FEC_TX_CLK	ALT6	O
ARM_TRACE28	Trace signal	FEC_TX_EN	ALT6	O
ARM_TRACE29	Trace signal	FEC_MDC	ALT6	O

*Table continues on the next page...*

**Table 12-1. ARM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
ARM_TRACE30	Trace signal	FEC_TXD0	ALT6	O
ARM_TRACE31	Trace signal	FEC_CRS_DV	ALT6	O
ARM_TRACE_CLK	Clock signal	LCD_HSYNC	ALT6	O
ARM_TRACE_CTL	Control signal	LCD_VSYNC	ALT6	O

## 12.3 Platform configuration

The [Bus](#), [Cortex A9 Core](#), and [L2 Cache](#) configuration options are contained in the following subsections.

**Table 12-2. Cortex-A9 revision**

Core	MP004-BU-50000-r2p10-0rel0
Neon	AT397-BU-50001- r2p0-00rel0
PL310	PL310-BU-00000-r3p2-00rel0

### 12.3.1 Platform and SCU configuration

**Table 12-3. Cortex-A9 configuration**

Option	Selected Value	Comments
MP_MODE	Yes	Multi-Processor mode
POWER_DOMAIN_WRAPPER	No	Wrappers to support power off of individual cores.
PTM_INTERFACE_PRESENT	Yes	Use PTM as part of Trace/Debug logic.
PARITY	Yes	Using RAM arrays which support parity.
CORE_NUM	1	Number of cores
INT_NUM	128	Number of interrupts (SPIs) in GIC
ACP_PRESENT	No	Accelerator Coherency Port (ACP)
MASTER_NUM	2	Number of 64-bit AXI output master ports.

## 12.3.2 Core configuration

**Table 12-4. Cortex-A9 Core configuration**

Option	Selected Value	Comments
DCACHESIZE	32	L1 Data cache size
ICACHESIZE	32	L1 Instruction cache size
TLBSIZE	128	
JAZELLE_PRESENT	Yes	Providing ARM's Jazelle technology hardware extensions.
FPU_PRESENT	No	The FPU functions are provided by NEON, thus additional FPU cannot be used.
NEON_PRESENT	Yes	Use MPE, NEON Co-Processor and FPU
PRELOAD_ENGINE_PRESENT	No	May only be beneficial in Video processing.

## 12.3.3 PL310 L2 Cache configuration

**Table 12-5. PL310 L2 Cache configuration**

Option	Selected Value	Comments
Cache way size	64 KB	(For total of 256 KB L2 size)
Number of cache ways	16	Performance enhancement versus 8 ways
RAM latencies	4 <sup>1</sup>	
Data RAM banking	Yes	Significantly improves cache throughput
Slave port 1 present	Yes	
Master port 1 present	Yes	
Parity logic	Yes	For military / surveillance applications, and side ease the process of identify memory related issues.
Lockdown by master	Yes	Increase L2 optimization
Lockdown by line	Yes	Increase L2 optimization
AXI ID width	5	
Address filtering	No	Help in timing closure, not required for symmetric AXI bus connectivity scheme.
Speculative read	Yes	Performance boost, when used with CortexA9.
Size of L2 cache	256 KB	Size is implied by Cache-Size times cache-ways (i.e. 256 KB )

1. Preliminary estimate, final value TBD.

## 12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

### 12.3.5 Memory Parity error support

The i.MX 6SoloLite ARM Cortex A9 MPCore™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

## 12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

### 12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on core
- Low leakage of LP process
- C4 package

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.
- Separate voltage for memories array is required to allow DVFS.
- On-chip power switches are not utilized by gating the power of the platform directly from the regulator.

#### 12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow<sup>2</sup>

---

1. Dormant mode implementation information, provided by ARM, is preliminary.

- Power down request
- Save cores' essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation on all cores
- Enter WFI state
- Power Gating of all cores' and platform logic

#### Power Up flow<sup>2</sup>

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and cores from memory by Dormant mode routines.

### 12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

## 12.4.2 Clocks, frequency goals

### 12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

### 12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

### 12.4.2.3 Debug Clocks

The ARM platform contains several debug components.

Their clock frequencies are as follows:

- Trace buffer (ETB) clock - 133 MHz

- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

## 12.5 Core Platform Sub-Blocks details

### 12.5.1 ARM Cortex A9 MPCore™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore™ processor in the chip consists of:

- Cortex A9 processors.
- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in [Platform configuration](#).

### 12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore™ Platform includes MPE per core.

### 12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

#### 12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
  - Up to 16 Software Generated Interrupts (SGIs)
  - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)
  - Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs .
  - Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more information, see ARM MPCORE Technical Reference Manual.

#### 12.5.3.2 About the Interrupt Controller

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

#### 12.5.3.3 Interrupt Controller Clock frequency

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

### 12.5.3.4 TrustZone support

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

## 12.5.4 Instruction and data caches (L1)

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

### 12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

## 12.5.5 L2 Cache and controller (PL310)

The platform includes unified (data / instruction) L2 cache unit, based on the cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See [Table 12-5](#) for more information.

## 12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 2 x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the [System Debug](#) chapter.

### 12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIV5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

### 12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolution of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by core and resources.
2. Nx PTMs, where N is numbers of cores in the system.

### 12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state
- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

### 12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See [System Debug](#) for more information on the CTI.

### 12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

#### 12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

## Chapter 13

# AHB to IP Bridge (AIPSTZ)

### 13.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). The peripheral bridge acts as an interface between the system bus and lower bandwidth IP Slave (IPS) bus peripherals.

#### 13.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

## 13.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 13-1. AIPSTZ Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

## 13.3 General Operation

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

It occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16K-byte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16 Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

## 13.4 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

## 13.5 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

## 13.6 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

## 13.7 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ\_MPRs), the Peripheral Access Control registers (AIPSTZ\_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ\_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

### 13.7.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

**Table 13-2. Peripheral Access Configuration options**

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec\_config\_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 13-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec\_config\_0 [7:0] = 8'b0011\_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

**Table 13-3. Security Levels**

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu\_sec\_level[2:0]' corresponding to each peripheral X.

## 13.8 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

## AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

## 13.8.2 Master Priviledge Registers (AIPSTZx\_MPR)

Each AIPSTZ\_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 13-6](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 13-7](#).

**Table 13-16. MPROT Field**

Bit	Field	Description
3	MBW	<b>Master Buffer Writes</b> - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	<b>Master Trusted for Reads</b> - This bit determines whether the master is trusted for read accesses.
1	MTW	<b>Master Trusted for Writes</b> - This bit determines whether the master is trusted for write accesses.

*Table continues on the next page...*

**Table 13-16. MPROT Field (continued)**

Bit	Field	Description
0	MPL	<b>Master Privilege Level</b> - This bit determines how the privilege level of the master is determined.

**NOTE**

The reset value is set to 0000\_0000\_7700\_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

**Table 13-17. Master Index Allocation**

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core and SDMA	Share the same number allocation.
Master 1	ARM CORE	
Master 2	Reserved	
Master 3	SDMA	
Master 4-15	Reserved

### 13.8.3 Off-Platform Peripheral Access Control Registers (AIPSTZx\_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 13-9](#)

**Table 13-19. OPAC Field**

Bit	Field	Description
3	BW	<b>Buffer Writes</b> - This bit determines whether write accesses to this peripheral are allowed to be buffered. <sup>1</sup>
2	SP	<b>Supervisor Protect</b> - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	<b>Write Protect</b> - This bit determines whether the peripheral allows write accesses.
0	TP	<b>Trusted Protect</b> - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.
1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.
1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

# Chapter 14

## Digital Audio Multiplexer (AUDMUX)

### 14.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in [Functional Description](#).

[Figure 14-1](#) shows the block diagram.

Figure 14-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

### 14.1.1 Features

Key features of the block include:

- Two or Three internal ports (depends on number of SSI supported on the device)
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

### 14.1.2 Modes and Operations

The AUDMUX supports the modes described in [Operating Modes](#).

## 14.2 External Signals

The following table describes the external signals of AUDMUX:

**Table 14-1. AUDMUX External Signals**

Signal	Description	Pad	Mode	Direction
AUD3_RXC (RXC)	Receive clock signal	AUD_RXC	ALT0	IO
AUD3_RXD (RXD)	Data receive signal	AUD_RXD	ALT0	IO
AUD3_RXFS (RXFS)	Receive Frame sync signal	AUD_RXFS	ALT0	IO
AUD3_TXC (TXC)	Transmit clock signal	AUD_TXC	ALT0	IO

*Table continues on the next page...*

**Table 14-1. AUDMUX External Signals (continued)**

Signal	Description	Pad	Mode	Direction
AUD3_TXD (TXD)	Data transmit signal	AUD_TXD	ALT0	IO
AUD3_TXFS (TXFS)	Transmit Frame sync signal	AUD_TXFS	ALT0	IO
AUD4_RXC (RXC)	Receive clock signal	I2C2_SDA	ALT1	IO
		LCD_DAT2	ALT4	
		SD2_CMD	ALT1	
AUD4_RXD (RXD)	Data receive signal	ECSP11_SS0	ALT1	IO
		LCD_DAT3	ALT4	
		SD2_DAT0	ALT1	
AUD4_RXFS (RXFS)	Receive Frame sync signal	I2C2_SCL	ALT1	IO

## 14.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 14-2. AUDMUX Clocks**

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 14.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg\_clk\_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

### 14.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

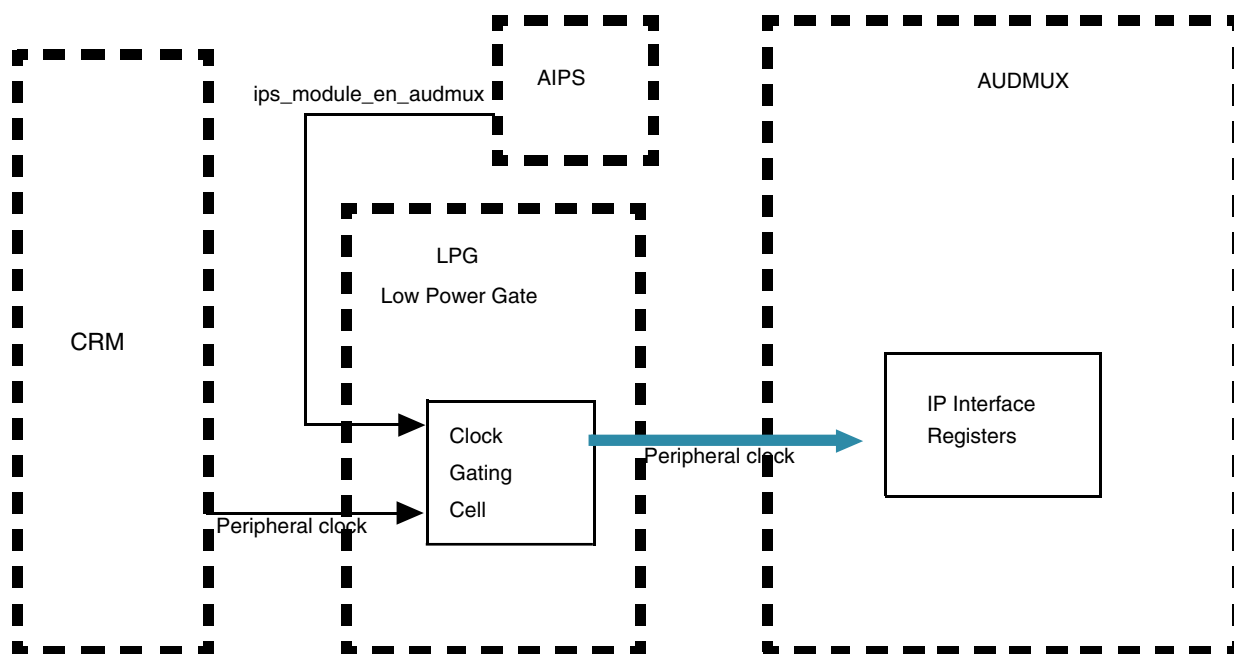

Figure 14-2. AUDMUX Clocking Scheme

### 14.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

## 14.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

[Default Port Configuration](#), describes the default configuration of the ports.

### 14.4.1 Default Port Configuration

After a reset, each port defaults to normal mode ( $PDCRn[MODE] = 0$ ) with synchronous timing mode ( $PTCRn[SYN] = 1$ ) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
  - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
  - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
  - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
  - Clock and frame syncs are inputs.

## 14.5 Functional Description

This section provides a complete functional description of the AUDMUX.

### 14.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

Figure 14-1 shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI's Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

### 14.5.1.1 Port Receive Data Modes

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

Figure 14-3 shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE:

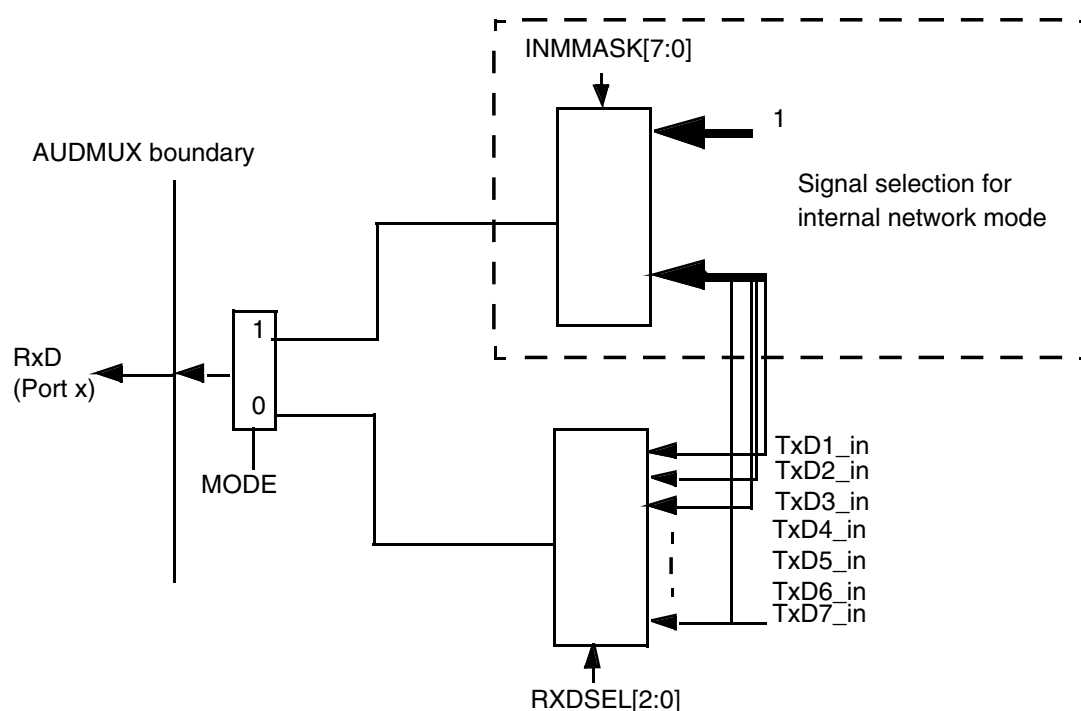

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to

multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.

- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

**Figure 14-3. Receive Data Logic for Port x**

#### 14.5.1.1.1 Normal Mode

In normal mode ( $\text{MODE} = 0$ ), not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the  $\text{RXDSEL}[2:0]$  setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others).

If a user wishes to transmit SSI1's data (TXD) to port 5, PDCR5's  $\text{RXDSEL}[2:0]$  must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1, PTCR5's  $\text{TFSEL}[3:0]$  and  $\text{TCSEL}[3:0]$  must be set to 0000b (port1) and 0000b (port1), while setting PTCR5's  $\text{TFSDIR}$  and  $\text{TCLKDIR}$  to 1.

If either or both of the clocks are to be received from external device to SSI1, PTCR5's TCLKDIR and/or TFSDIR must be set to 0 (input), and PTCR1's RFSEL[3:0] and/or TCLKDIR[3:0] to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set PDCR2's RXDSEL[2:0] to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device, PTCR2's RFSEL[3:0] and RCSEL[3:0] must be set to 011b while PTCR4's RFSDIR and RCKDIR set to 1.

#### 14.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1), the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn\_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

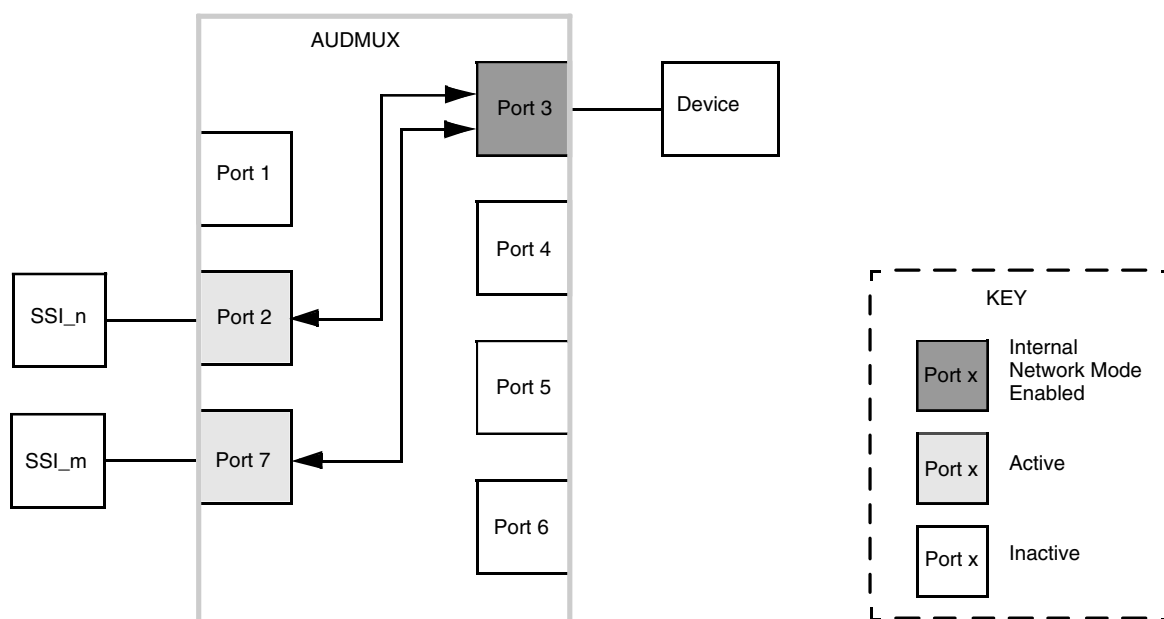

#### NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn\_obe selection is ignored and RxD\_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

#### Internal Network Mode Example 1

SSI\_m and SSI\_n are used with Port 3 in internal network mode as shown in [Figure 14-4](#). No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

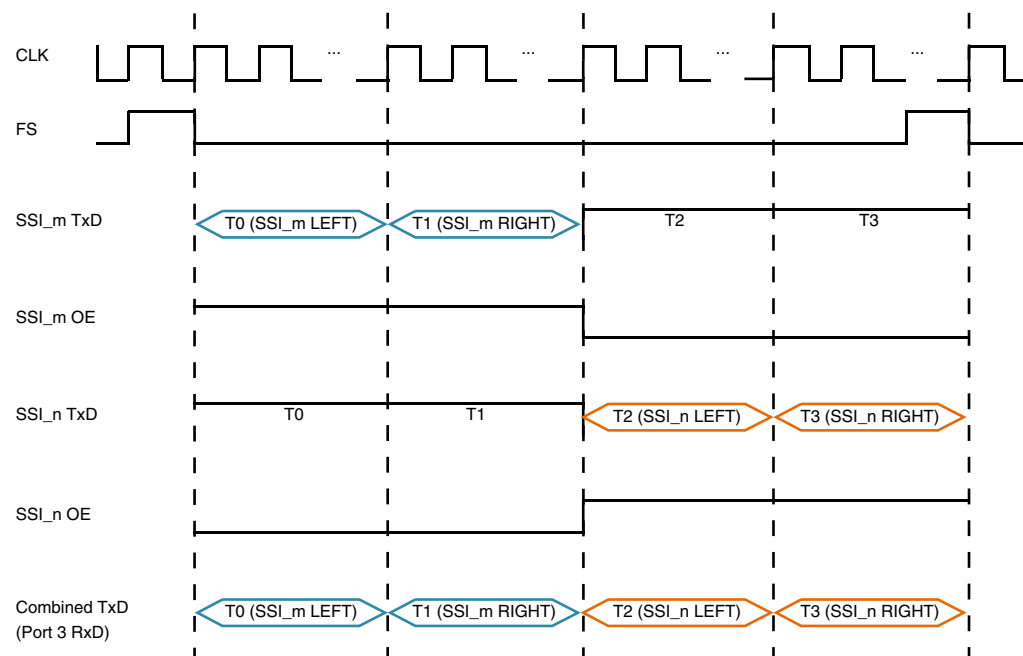

**Figure 14-4. Block Diagram For Example 1**

See [Figure 14-5](#) for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for SSI\_m and SSI\_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

**Figure 14-5. Example Using Internal Ports For Transmit Data**

### Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

**Figure 14-6. Block Diagram For Example 2**

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

$R_{max} = 1 / (2 * f_{bc} * C)$  where:

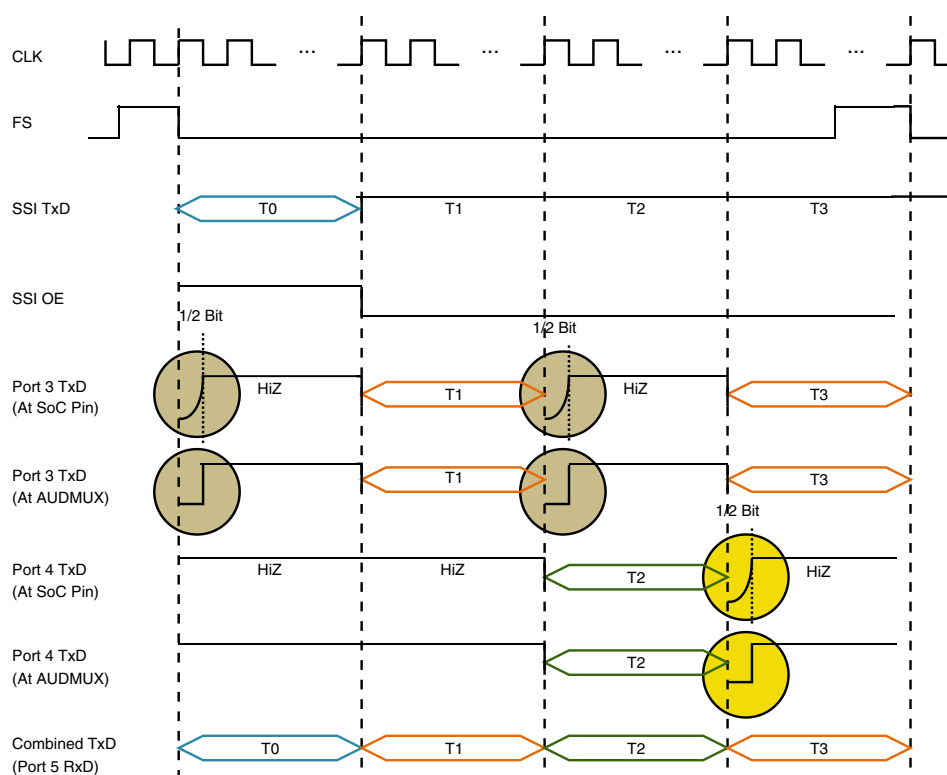

- $f_{bc}$  is the frequency of the bitclock
- $C$  is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

Note the highlighted areas in the [Figure 14-7](#). This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

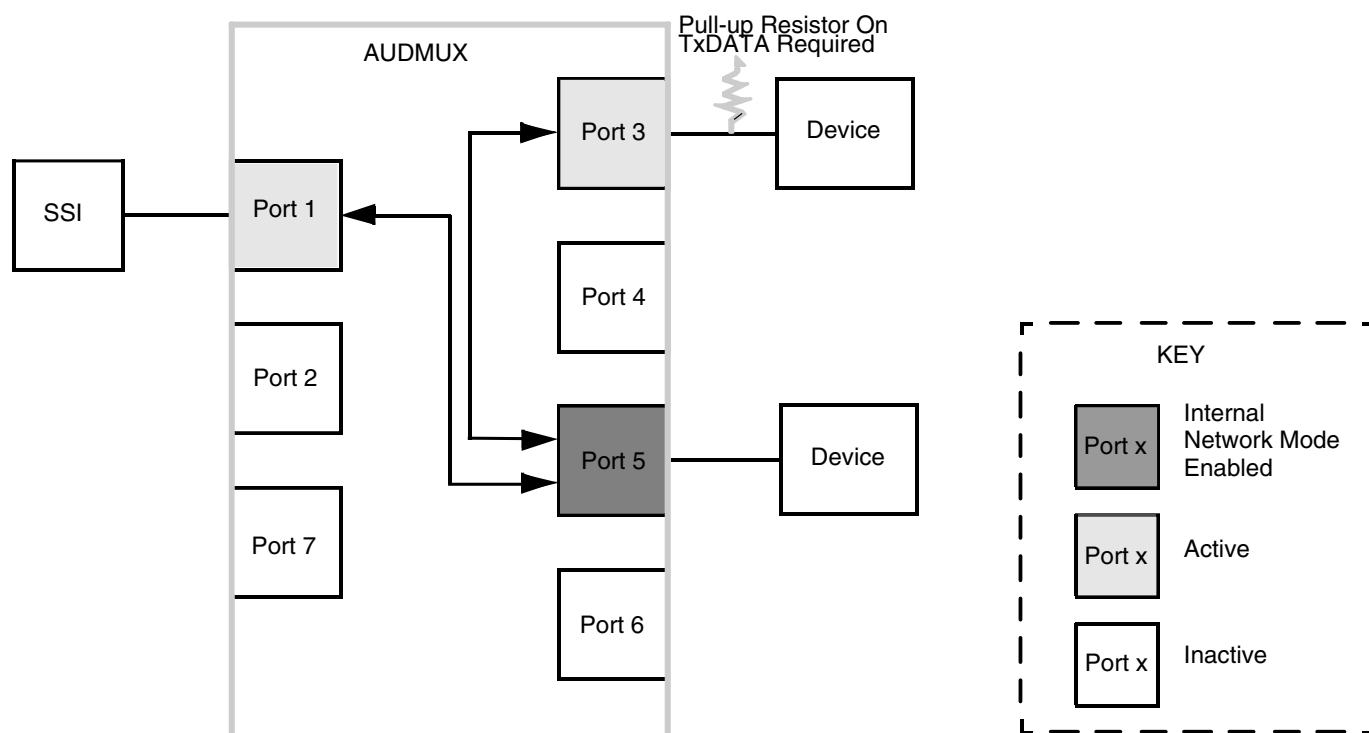

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

**Figure 14-7. Example Using External Ports for Transmit Data in Consecutive Timeslots**

### Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

**Figure 14-8. Block Diagram For Example 3**

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

$R_{max} = (4 * n + 1) / (2 * f_{bc} * C)$  where:

- $n$  is the number of bits per timeslot
- $f_{bc}$  is the frequency of the bitclock
- $C$  is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the [Figure 14-9](#). This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

**Figure 14-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots**

#### 14.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD\_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD\_obe is always asserted after the port data register configuration.

### 14.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. `RxD_obe` is the output buffer enable signal and `RxD_out` is the data transmit signal from the serial interface. The `TxD_in` signal is the receive data signal going towards the `RXDSEL` muxes of all ports.

`D_TxRx` is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. `D_RxTx` is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When `TXRXEN` is disabled (`TXRXEN=0`), `RxD_out` is routed to `D_TxRx` and `D_RxTx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Db_obe`.

When the Tx/Rx switch is enabled (`TXRXEN=1`), `RxD_out` is routed to `D_RxTx` and `D_TxRx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Da_obe`.

If the `RXDSELn[2:0]` field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by `RXDSELn[2:0]` and is routed to `Dan_obe/Dbn_obe`. In the case when the `RXDSELn[2:0]` field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to `Dan_obe/Dbn_obe`, depending on the `TXRXENn` switch configuration.

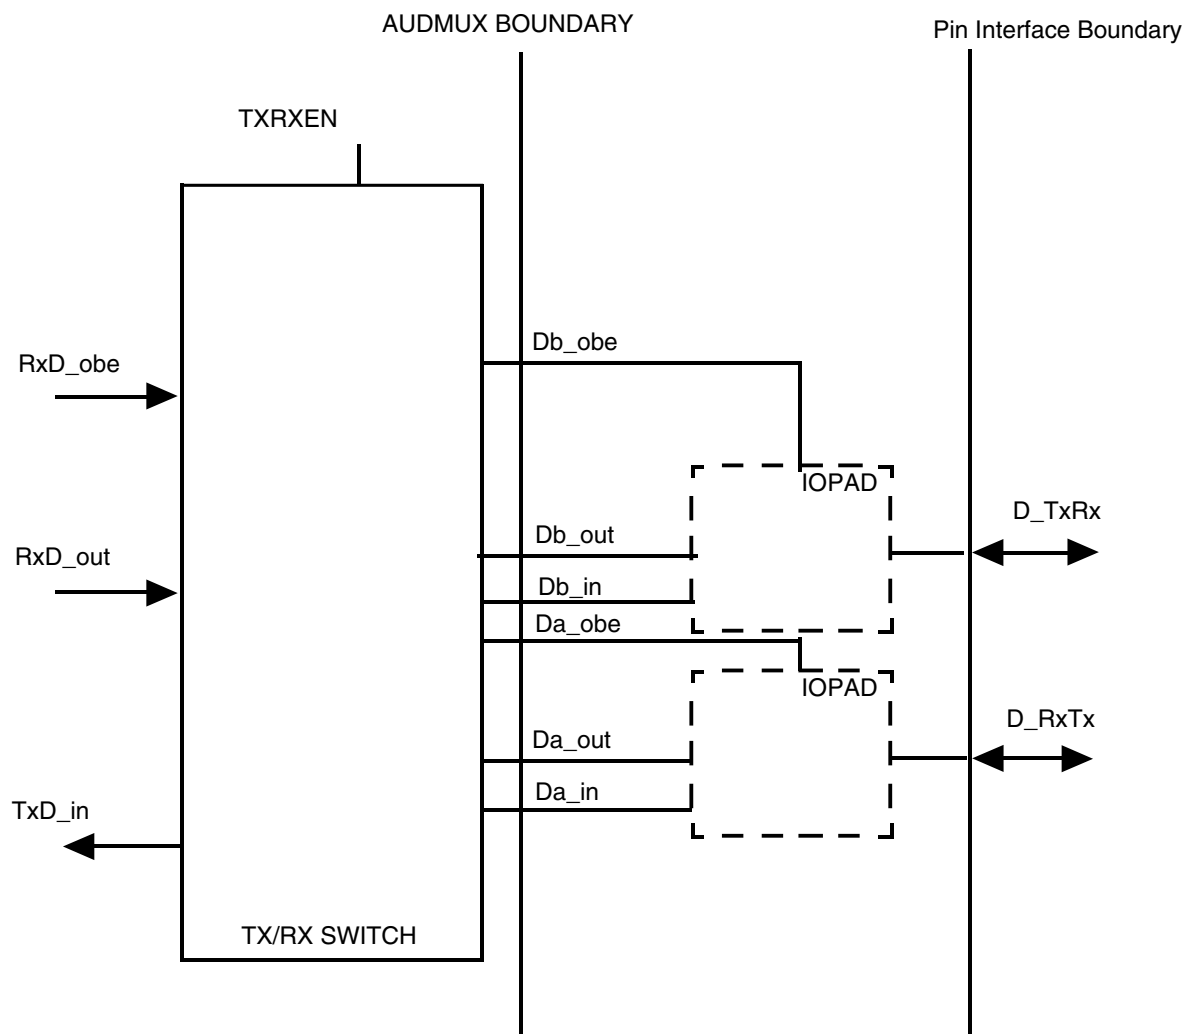

Figure 14-10. Tx/Rx Switch

### 14.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

#### 14.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When  $SYN = 1$  the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS\_in, RFS\_in, TCLK\_in, and RCLK\_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (\_obe). TFS\_out, RFS\_out, TCLK\_out, and RCLK\_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS\_out and TCLK\_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS\_out and RCLK\_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS\_obe and FS\_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS\_out and RCLK\_out pins at Port y are not available.

**Figure 14-11. Frame Sync and Clock Routing When External Port Is 4-Wire**

#### 14.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS\_in, RFS\_in, TCLK\_in, and RCLK\_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (\_obe). TFS\_out, RFS\_out, TCLK\_out, and RCLK\_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS\_out and TCLK\_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS\_out and RCLK\_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS\_obe and TxFS\_out signals and TCSEL selects the TxCLK\_obe and TxClk\_out signals. The RFSEL selects the RxFS\_obe and RxFS\_out signals and RCSEL selects the RxCLK\_obe and RxCLK\_out signals.

### NOTE

Because FS\_in and CLK\_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

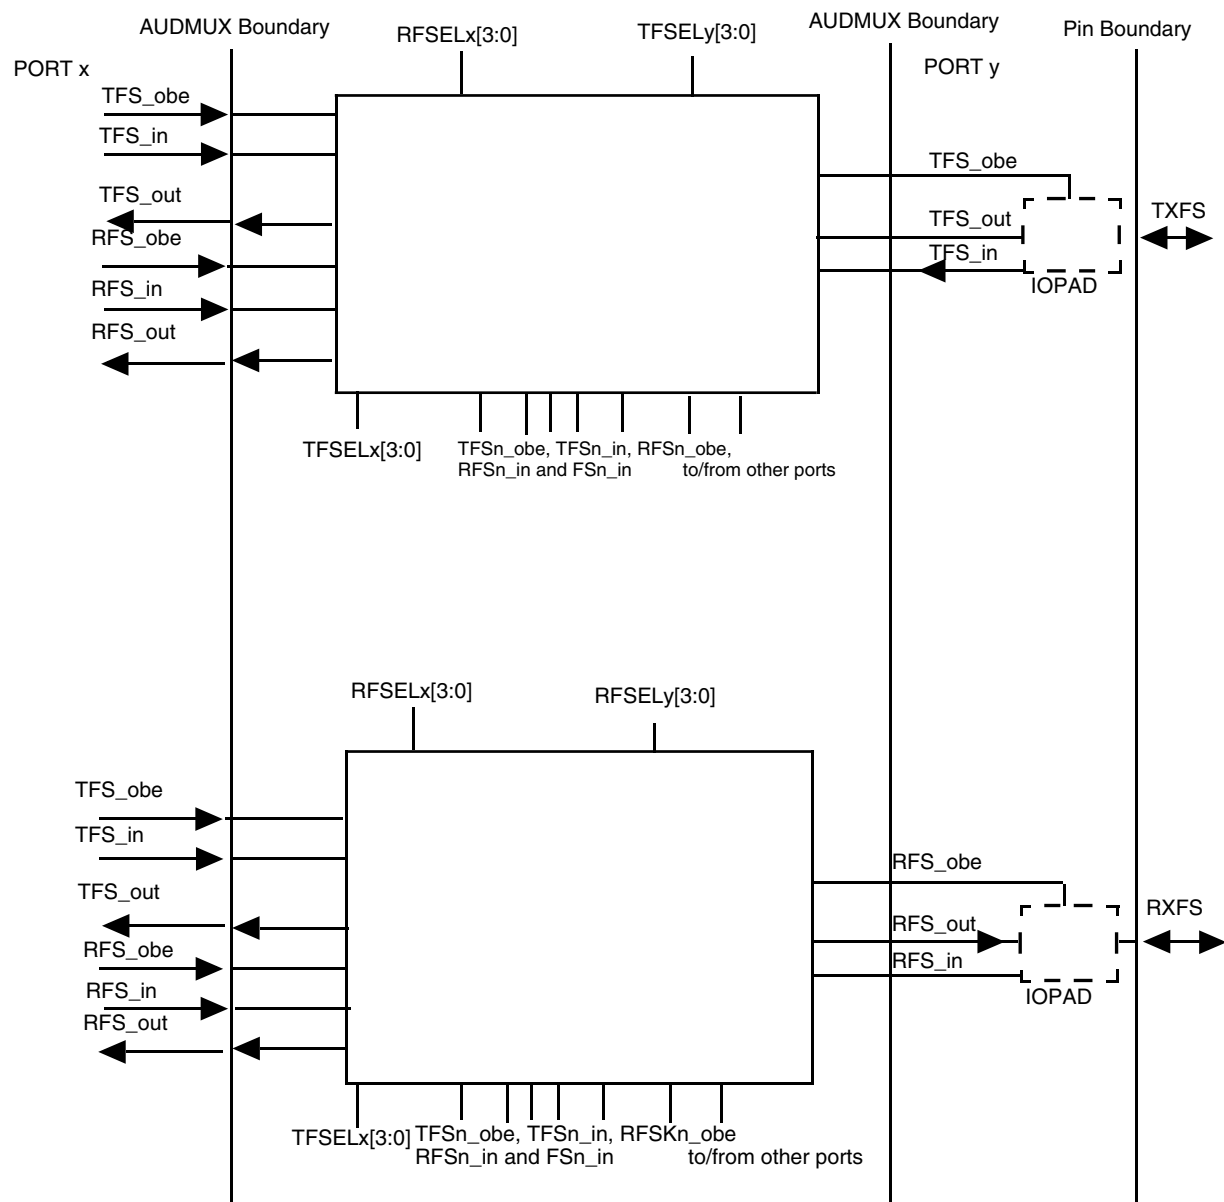

Figure 14-12. Frame Sync Routing When External Port Is 6-Wire

**Figure 14-13. Clock Routing When External Port Is 6 Wire**

### 14.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

### 14.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD\_obe is the buffer enable signal from the serial interface, TxD\_in is the input transmit data from the serial interface to the AUDMUX, and RxD\_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD\_obe) and transmit data output (TxD\_out) signal from the TxD\_obe and RxD\_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

#### NOTE

Because buffer TxD\_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD\_in, as RxD\_out will also drive the RxD\_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD\_out. RxD\_out is routed to Da\_TxRx when TXRXEN is disabled and to D\_RxTx when TXRXEN is enabled. Similarly, D\_RxTx is routed to TxD\_in when TXRXEN is disabled and D\_TxRx is routed to TxD\_in when TXRXEN is enabled. The routing of frame syncs is shown in [Figure 14-12](#) and the routing of interface clocks is shown in [Figure 14-10](#).

If internal network mode is disabled, then RXDSEL selects the TxD\_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD\_out is constructed by ANDing selected TxD\_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D\_TxRx and D\_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

### 14.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

### 14.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

### 14.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD\_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD\_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

## 14.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

**AUDMUX memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21D_8000	Port Timing Control Register 1 (AUDMUX_PTCR1)	32	R/W	AD40_0800h	<a href="#">14.6.1/469</a>
21D_8004	Port Data Control Register 1 (AUDMUX_PDCR1)	32	R/W	0000_A000h	<a href="#">14.6.2/471</a>

### AUDMUX\_PTCR1 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync.  0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.  0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced.  0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1

Table continues on the next page...

## AUDMUX\_PTCR1 field descriptions (continued)

Field	Description
	x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync.  0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock.  <b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.  0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports.  0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
11 SYN	Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface).  <b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.  0 Asynchronous mode 1 Synchronous mode (default)
10–0 Reserved	This read-only field is reserved and always has the value 0.

## 14.6.2 Port Data Control Register 1 (AUDMUX\_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D\_8000h base + 4h offset = 21D\_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**AUDMUX\_PDCR1 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled).  xxx    Port number for RXD 000    Port 1 110    Port 7 111    Reserved
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals.  0    No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1    Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.
8 MODE	Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following: <ul style="list-style-type: none"> <li>Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port.</li> <li>Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together.</li> </ul> 0    Normal mode 1    Internal Network mode

*Table continues on the next page...*

**AUDMUX\_PDCR1 field descriptions (continued)**

Field	Description
7-0 INMMASK[7:0]	Internal Network Mode Mask. Bit mask that selects the ports from which the RXD signals are to be ANDed together for internal network mode. Bit 6 represents RXD from Port 7 and bit0 represents RXD from Port 1.  0 Includes RXDn for ANDing 1 Excludes RXDn from ANDing

**14.6.3 Port Timing Control Register 2 (AUDMUX\_PTCR2)**

PTCR2 is the Port Timing Control Register for Port 2.

Address: 21D\_8000h base + 8h offset = 21D\_8008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## AUDMUX\_PTCR7 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync.  0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.  0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced.  0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync.  0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock.  <b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.  0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports.

# Chapter 15

## Clock Controller Module (CCM)

### 15.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of DVFS and power gating operations.

#### 15.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

### 15.1.2 CCM Block Diagram

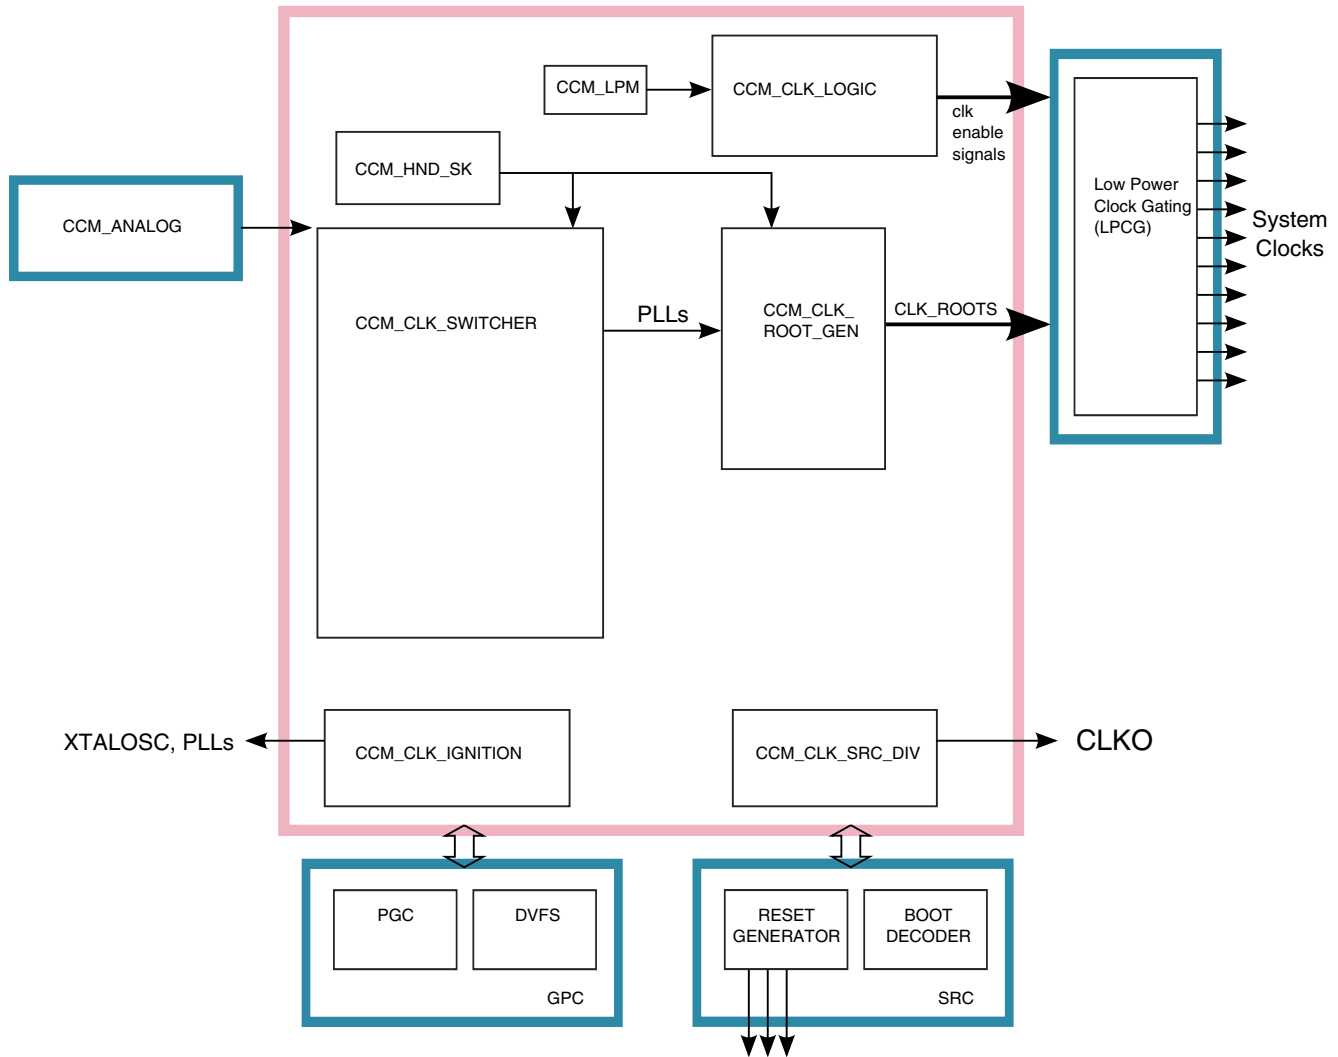

Figure 15-1. Block Diagram

CCM Contains the following sub-blocks:

Table 15-1. CCM Sub-blocks

Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the four PLLs, together with the bypass clocks for four PLLs , and generates three switcher clock outputs (pll1_sw_clk, pll2_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the four main clocks (PLL1, PLL2, PLL3, PLL4) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

**Table 15-1. CCM Sub-blocks (continued)**

Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_CLK_SRC_DIV	Passes CCM_CLKO output clock for observability. Output clock is connected to the pad and can provide support for testing.
CCM_HND_SK	Manages the handshake when changing root clock dividers that require handshake, and manages the frequency change in case of dvfs scenario.

## 15.2 External Signals

The following table describes the external signals of CCM:

**Table 15-2. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_CLKO	Observability clock output	PWM1	ALT1	O
CCM_PMIC_READY	Signal coming from PMIC to indicate that the voltage started to change as result of change in CCM_PMIC_VSTBY_REQ	FEC_REF_CLK	ALT4	I
		LCD_RESET	ALT6	
		REF_CLK_24M	ALT4	
		SD1_DAT7	ALT3	
CCM_PMIC_VSTBY_REQ	Goes to PMIC_VSTBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	PMIC_STBY_REQ	No Muxing (ALT0)	I

## 15.3 CCM Clock Tree

The figure found here shows the clock tree configuration and clock roots for CCM.

For detailed sub-block information, please see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

### NOTE

The default frequency values (in MHz) for the PLLs and PFDs is the maximum allowed frequency. The PLL and PFD control registers should not be programmed to exceed these values.

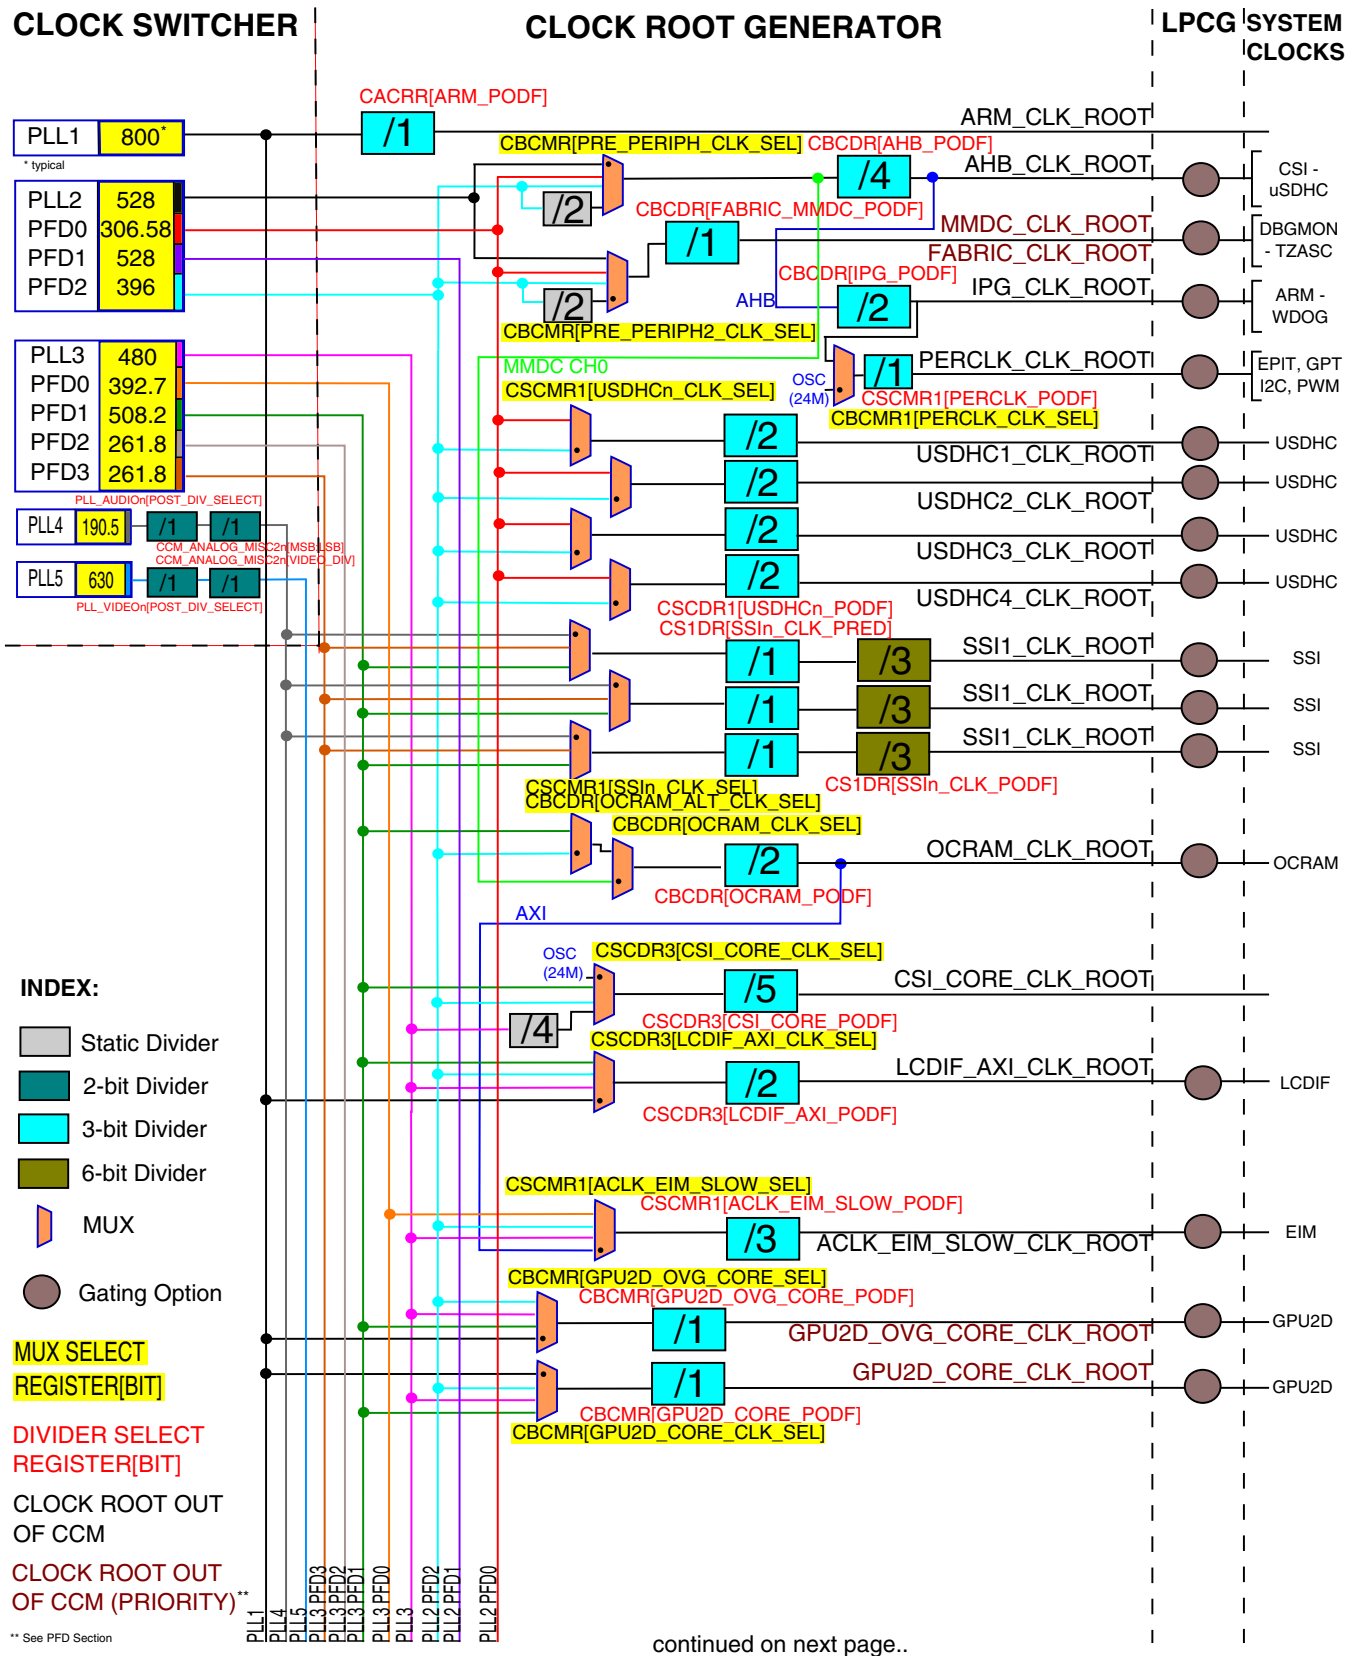

Figure 15-2. Clock Tree - Part 1

### Figure 15-3. Clock Tree - Part 2

## 15.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

## 15.5 Functional Description

This section provides a complete functional description of the block.

## 15.5.1 Clock Generation

### 15.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

#### 15.5.1.1.1 CKIL synchronizing to IPG\_CLK

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

### 15.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

### 15.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency 1 GHz)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

#### 15.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. Note that the PLL's upper frequency range exceeds the maximum frequency supported by the system. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

$$\text{PLL output frequency} = \text{Fref} * \text{DIV\_SEL}/2$$

#### 15.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

#### 15.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 3 PFD outputs.

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

#### 15.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4, /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

### 15.5.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a 50 MHz clock. The reference clocks generated by this PLL are:

- fixed 125 MHz
- fixed 100 MHz
- Ref\_ethernet, which is configurable based on the PLL\_ENET[1:0] register field.

### 15.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{vco} \times 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.freescale.com](http://www.freescale.com) for procedure details.

The chip has 7 PFDs, of which one is fixed-frequency. The others are assigned to a prioritized clock root. Prioritized clock roots are set by software and have priority over other shared clock roots. Non-prioritized clock roots should only select a particular PFD as their source clock if the frequency is appropriate or not selected by the main prioritized clock root. All clock roots have been designed with sufficient clock source selections to avoid a mutually-exclusive condition in which two clock sources must use a PFD simultaneously, but require incompatible frequencies.

The following table shows the clock root to PFD priority assignments.

#### NOTE

PLL2\_PFD2 should be programmed at a fixed frequency of 396MHz.

Root Clock with Priority	PFD Assigned
FABRIC_CLK_ROOT/MMDC_CLK_ROOT	PLL2_PFD0

*Table continues on the next page...*

## Functional Description

Root Clock with Priority	PFD Assigned
EPDC_PIX_CLK	PLL2_PFD1
LCDIF_PIX_CLK	PLL3_PFD0
GPU2D_OVG_CORE_CLK_ROOT/GPU2D_CORE_CLK_ROOT	PLL3_PFD1
EPDC_AXI_CLK	PLL3_PFD2
PXP_AXI_CLK	PLL3_PFD3

### 15.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

CCM\_CLK\_ROOT\_GEN

#### 15.5.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 15-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

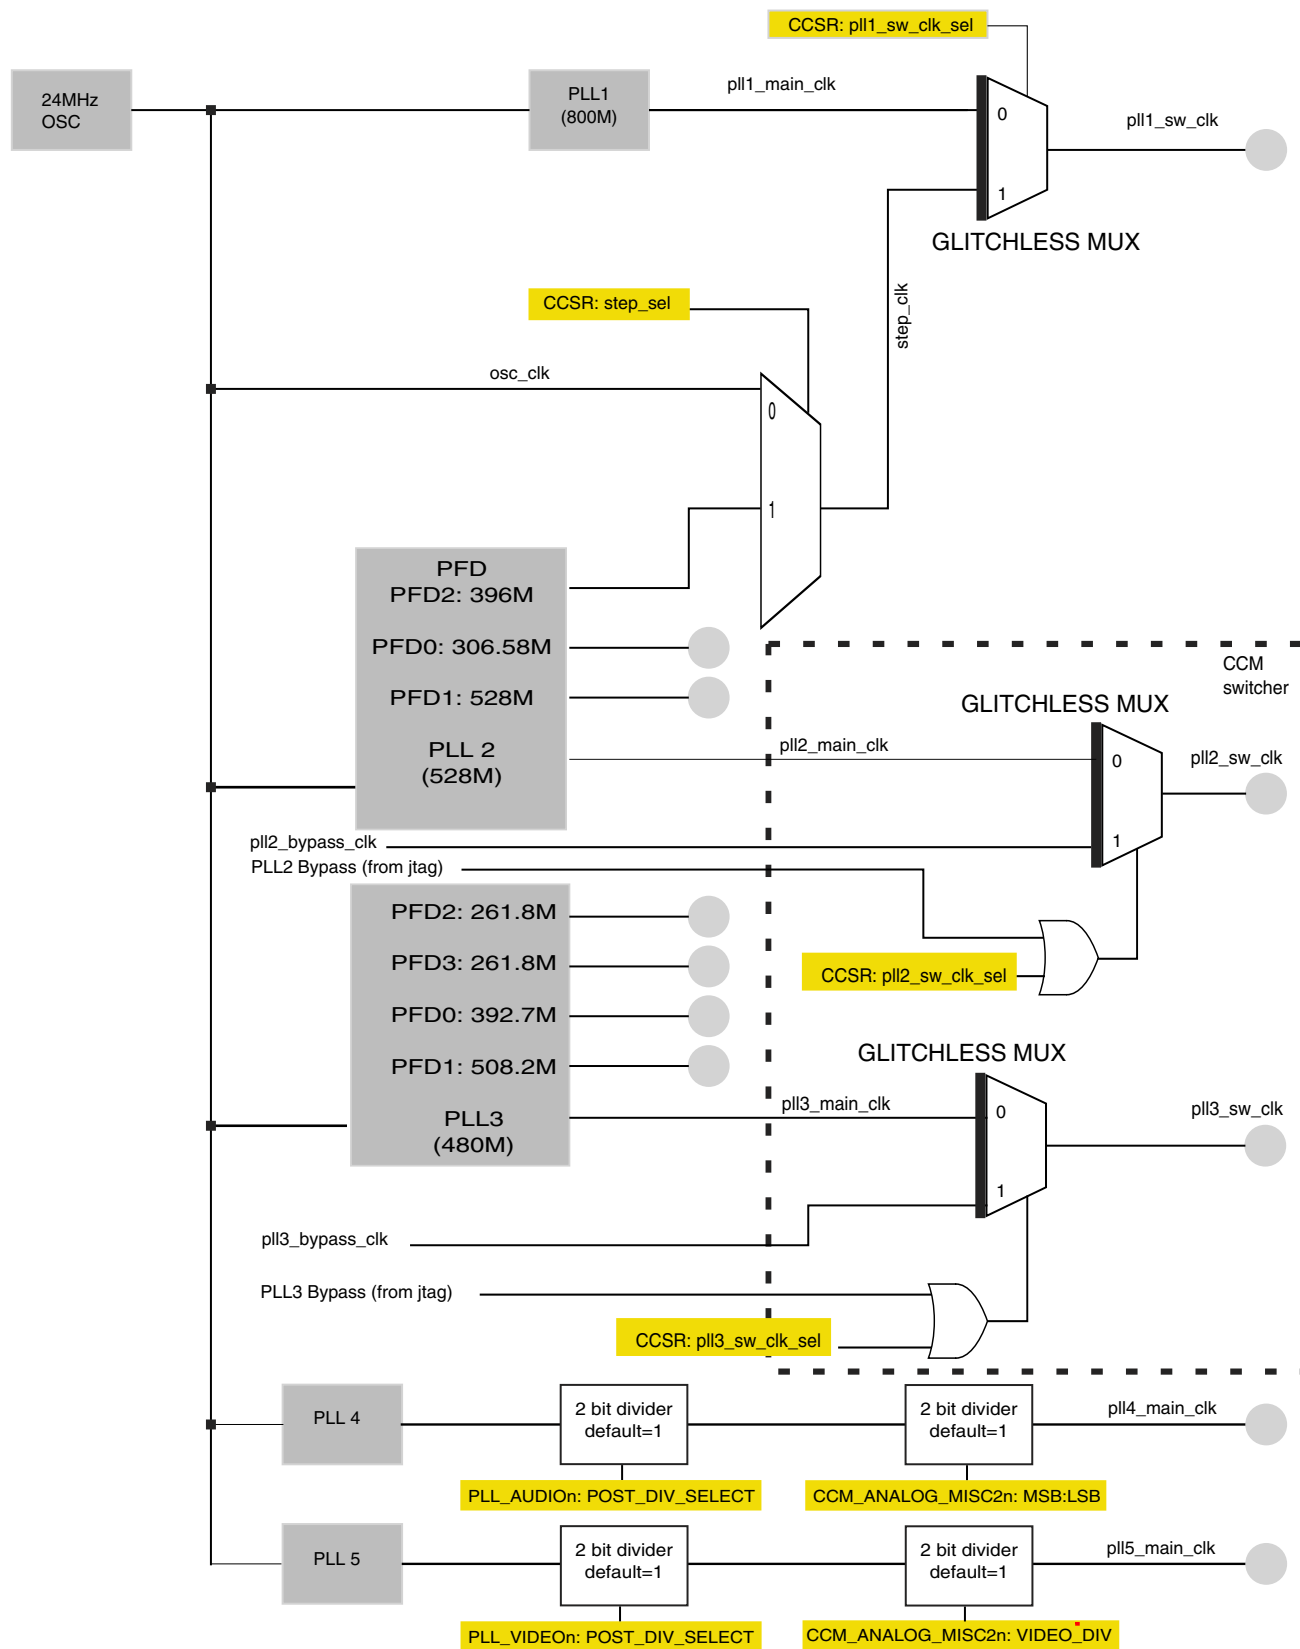

Figure 15-4. Switcher clock generation

### 15.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM\_ANALOG module, switcher and clk\_root\_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clk, and in this way supply to the pll\_sw\_clk outputs an external bypass clock.

### 15.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

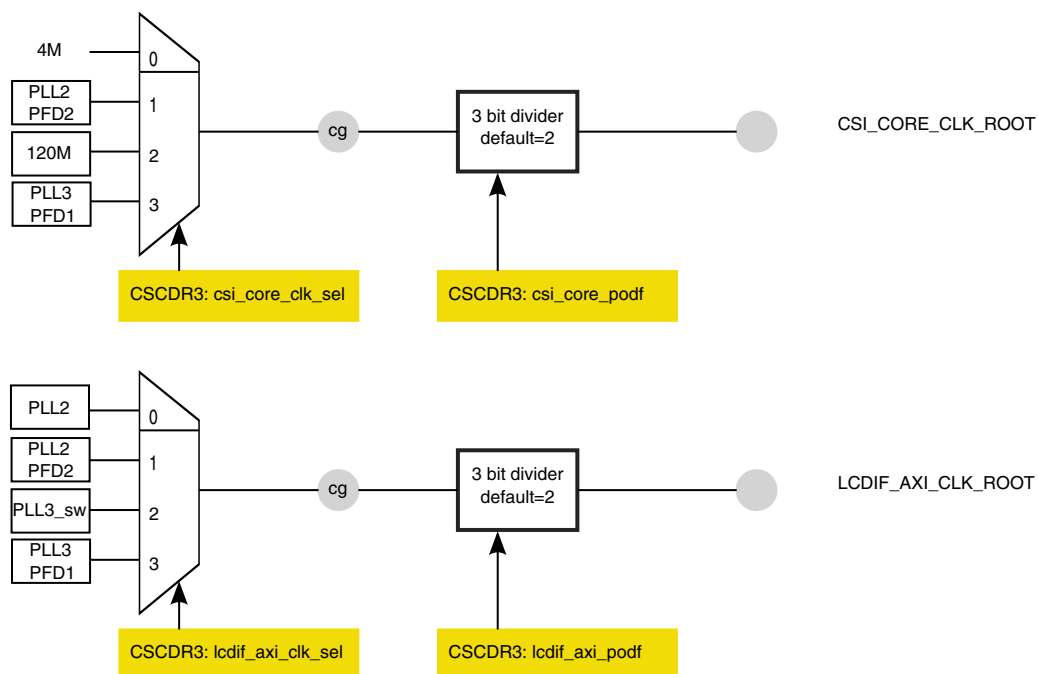

### 15.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

## Functional Description

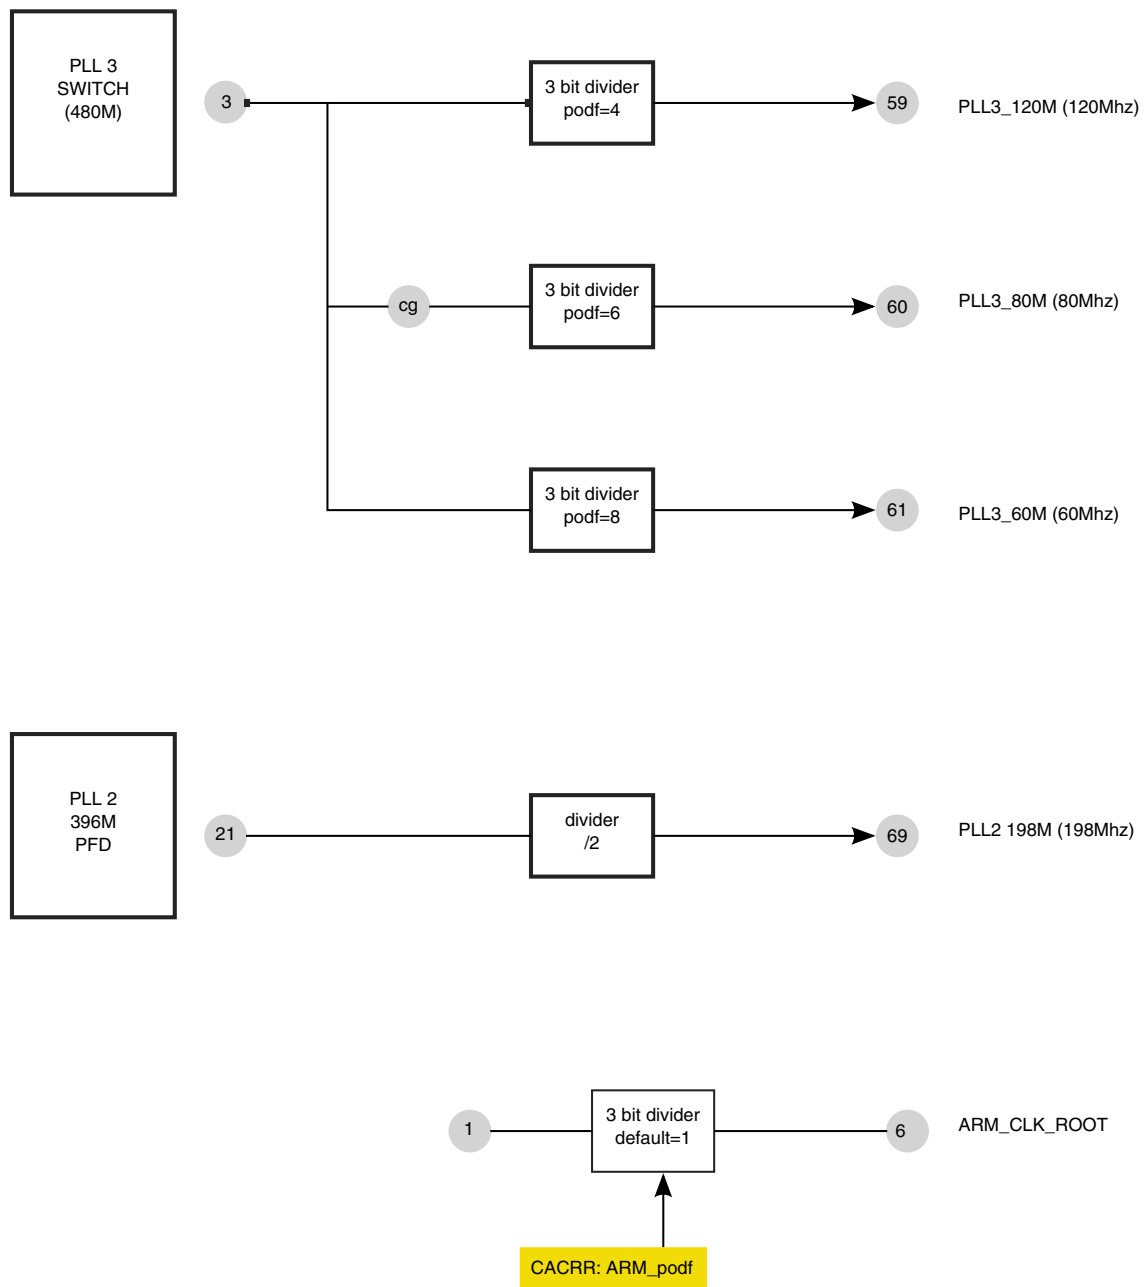

Figure 15-6. AXI clocks generation

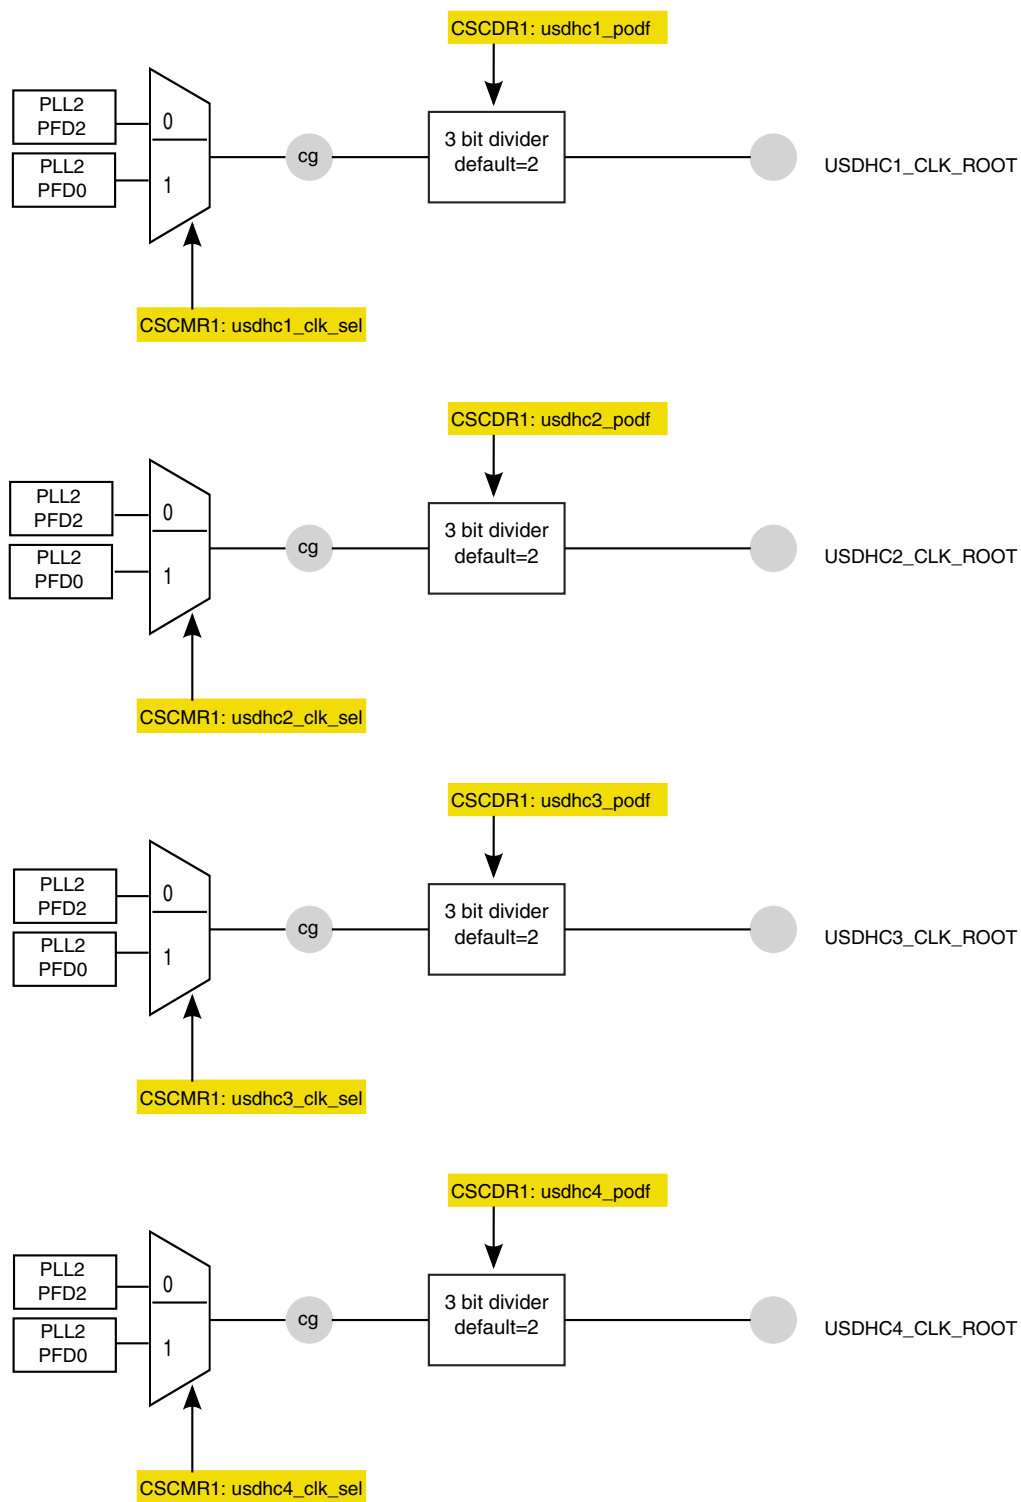

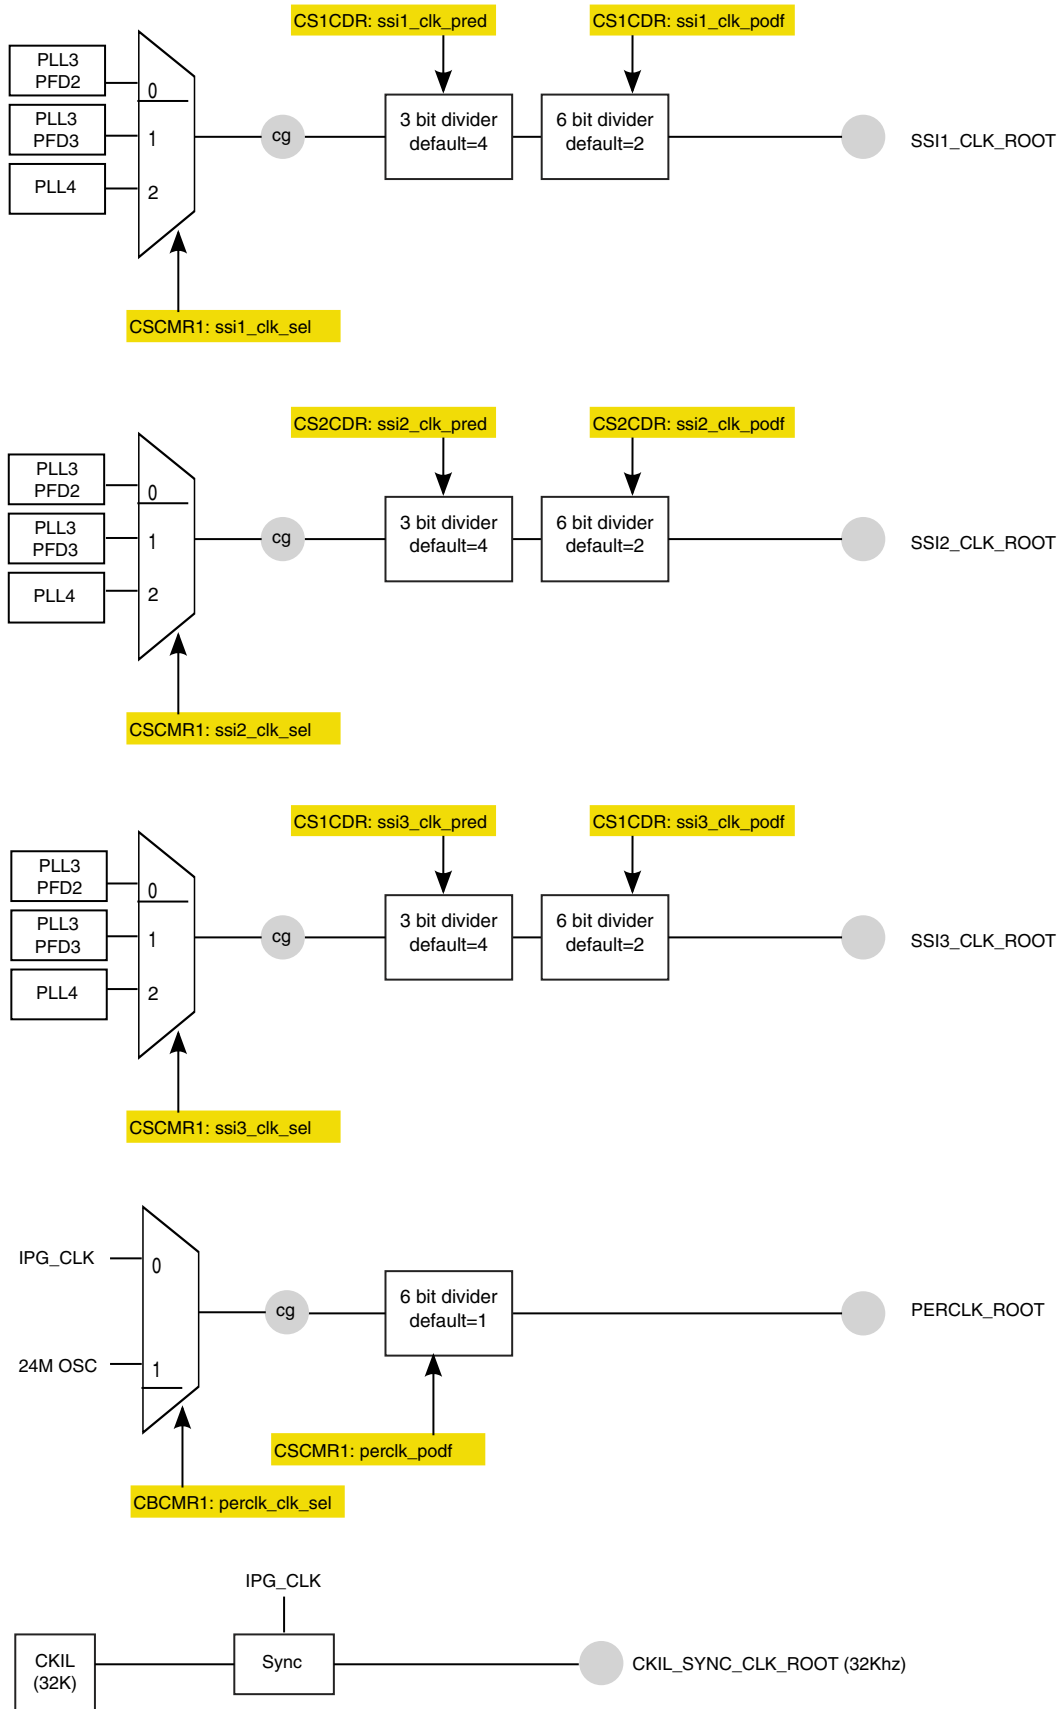

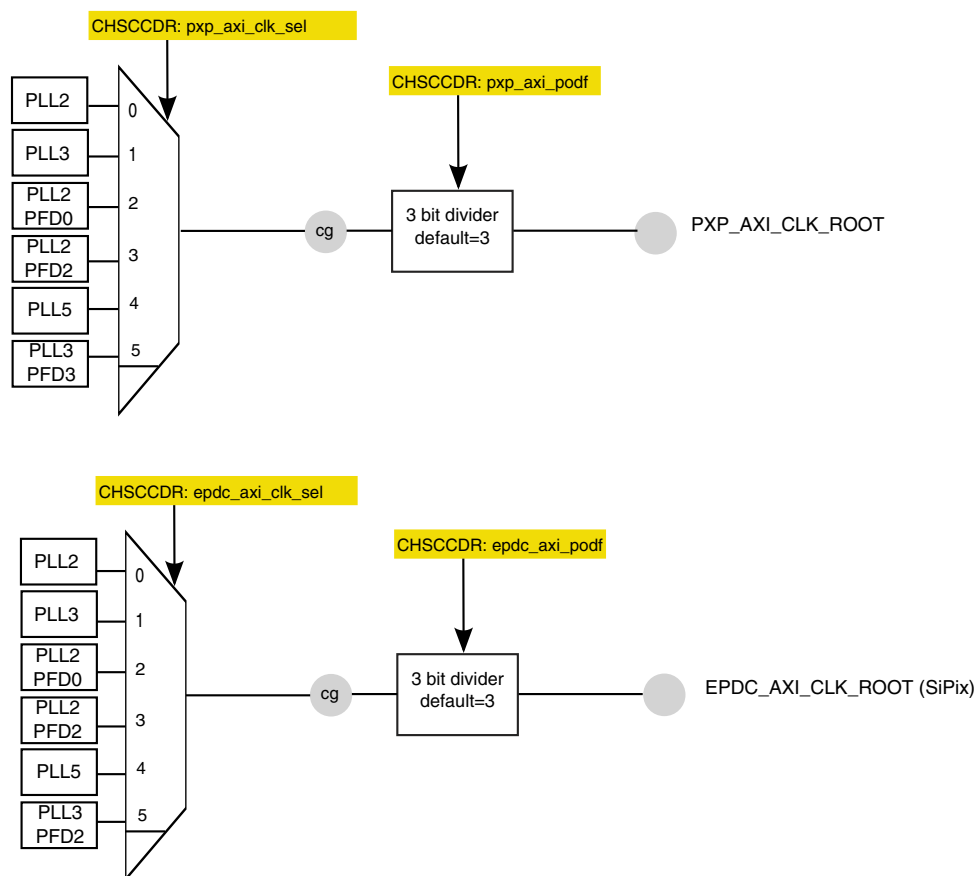

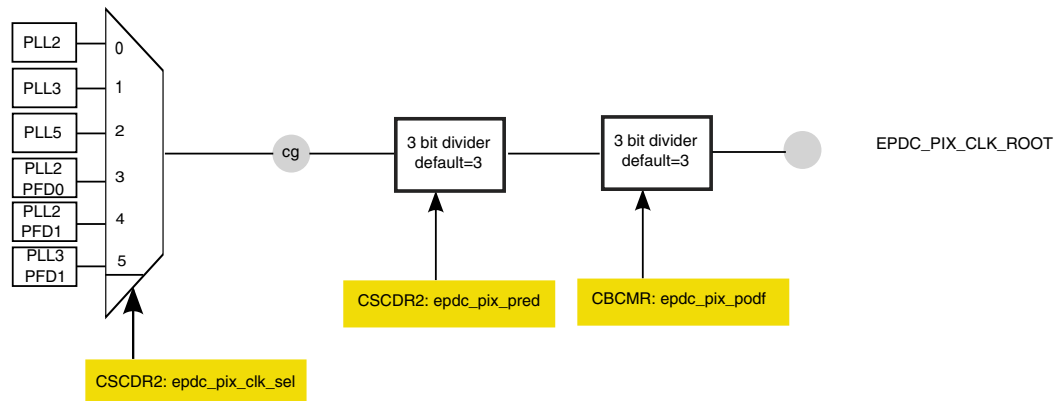

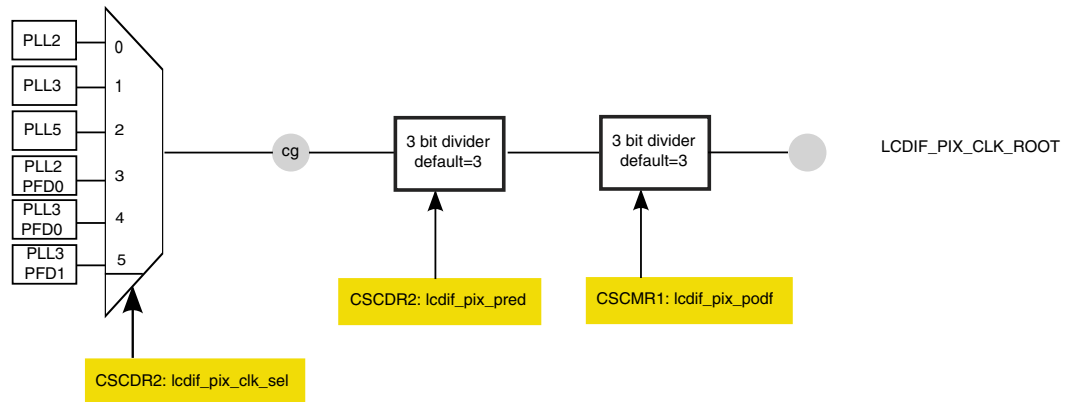

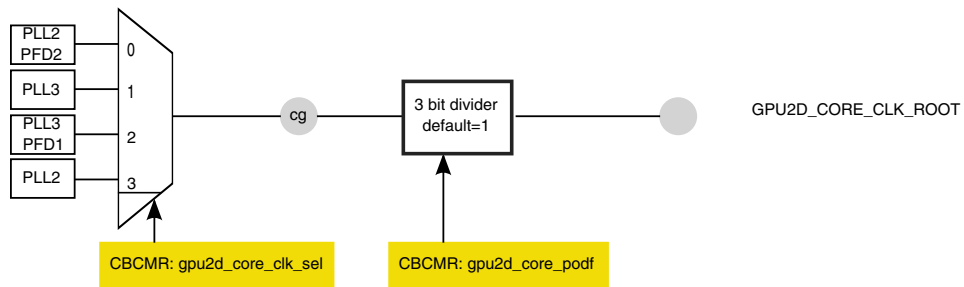

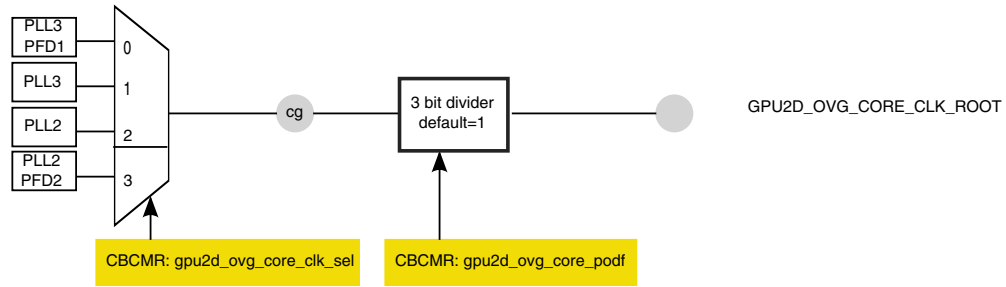

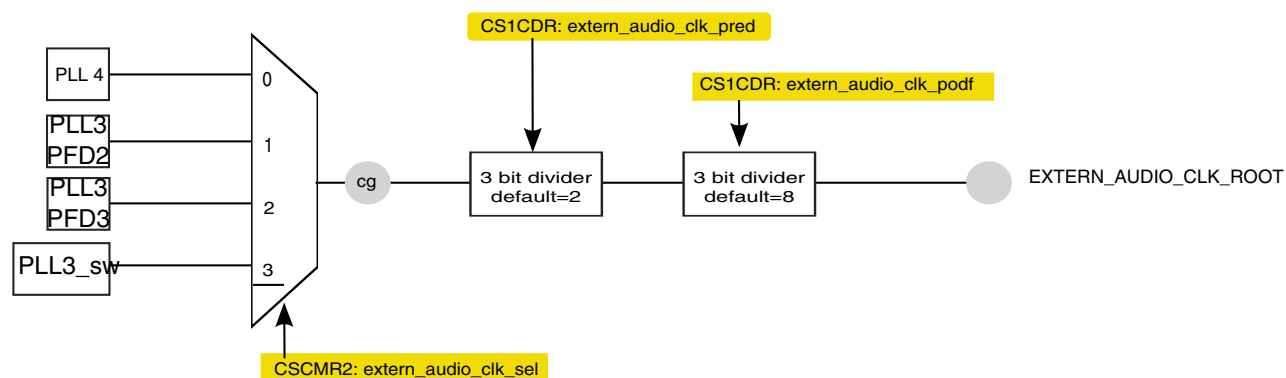

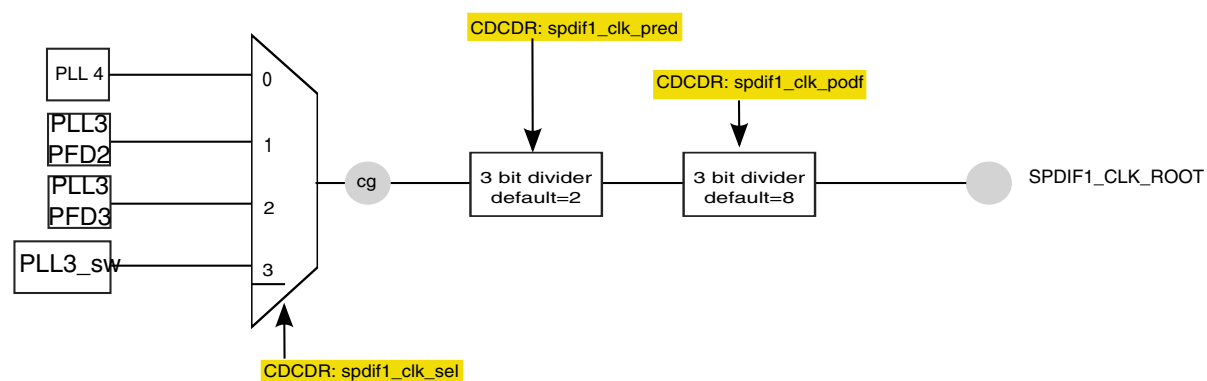

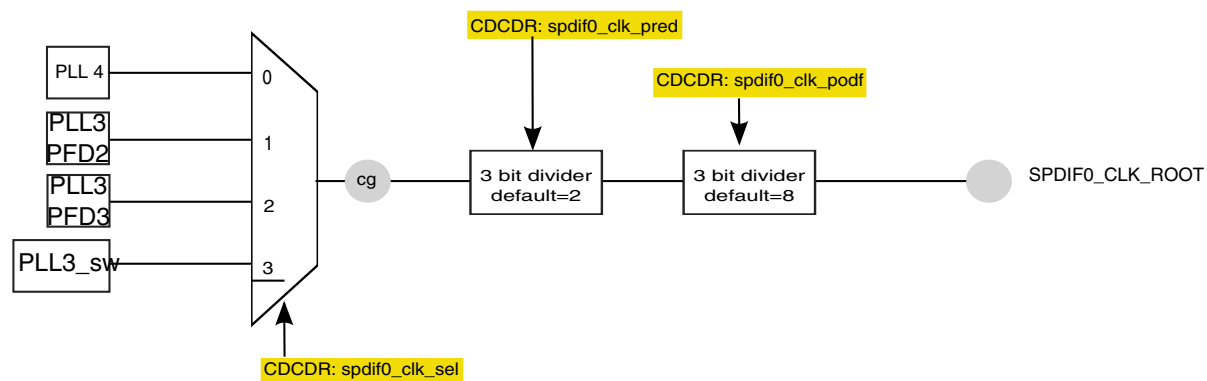

Figure 15-7. Serial clock generation

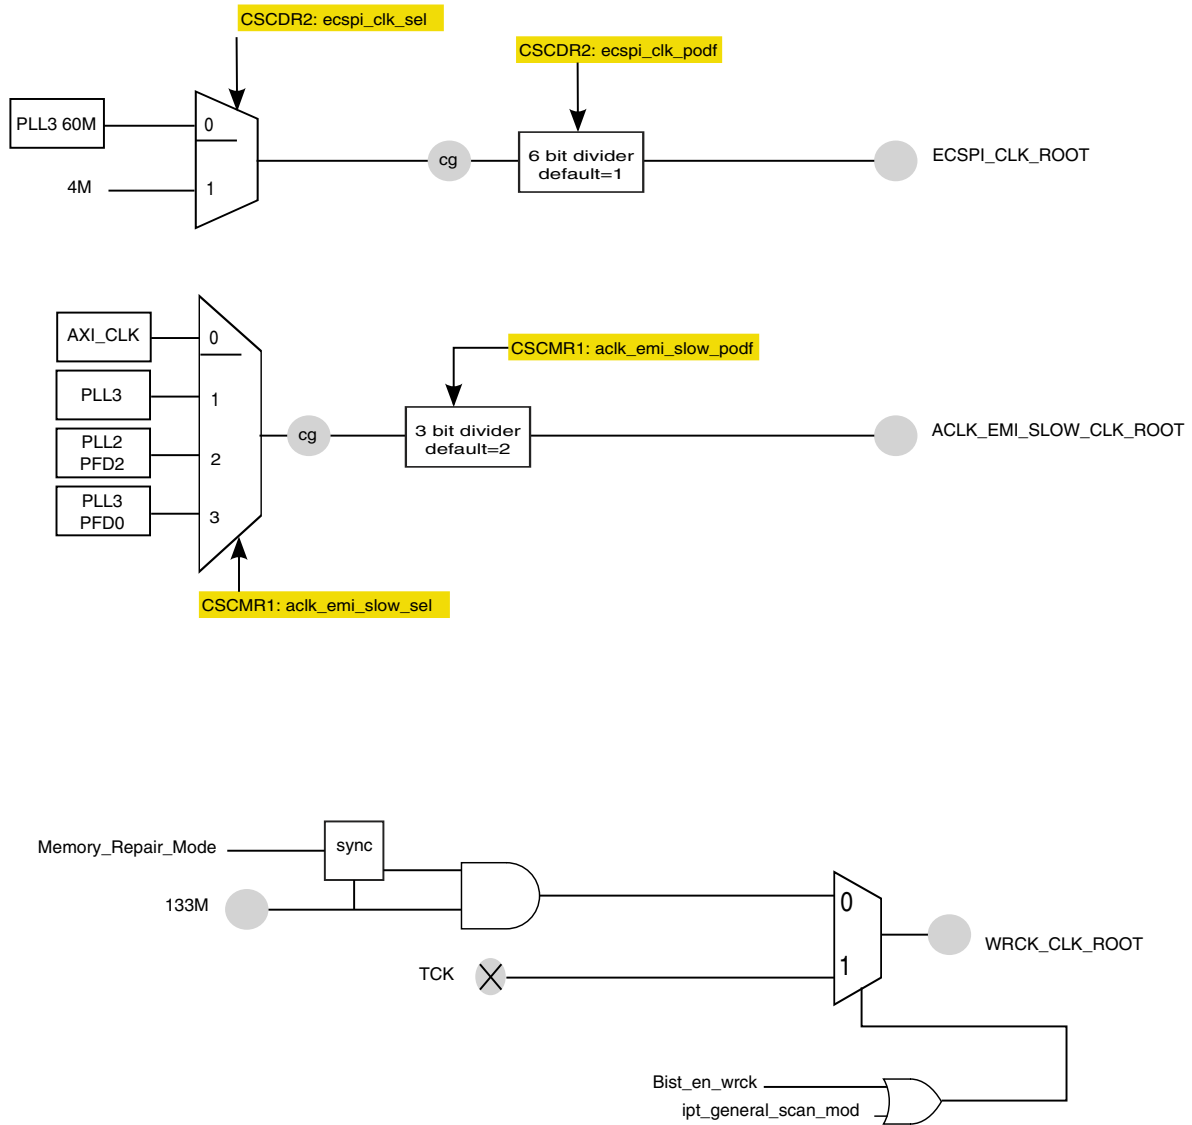

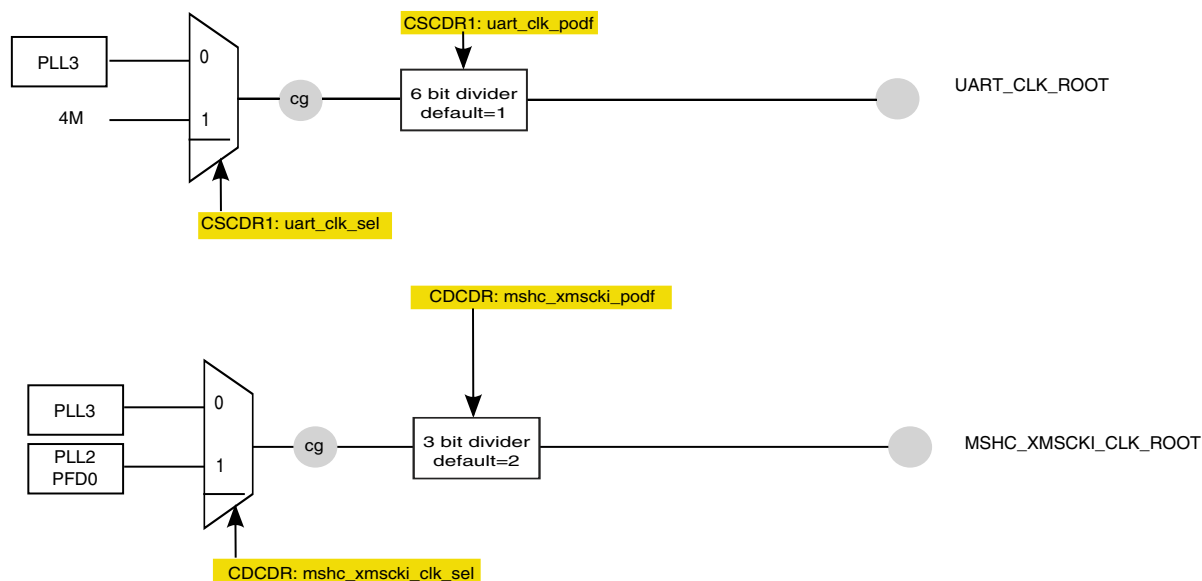

## Functional Description

**Figure 15-8. UART clock generation (cont)**

### NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

#### 15.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programmability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init\_mmdc\_axi\_podf
- [2:0] init\_periph2\_clk2\_podf
- [1:0] init\_ipg\_podf
- [2:0] init\_ahb\_podf
- [2:0] init\_axi\_podf
- [2:0] init\_periph\_clk2\_podf
- init\_periph\_clk\_sel
- init\_periph2\_clk\_sel

#### 15.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC ROOT and/or CH0.

- mmdc\_ch0\_axi\_podf
- mmdc\_root\_axi\_podf
- periph\_clk\_sel
- periph2\_clk\_sel

#### 15.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL. For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 15-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the FABRIC\_CLK\_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH2\_CLK2\_SEL] and CBCDR[PERIPH2\_CLK2\_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH2\_CLK\_SEL].

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

#### 15.5.1.7 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

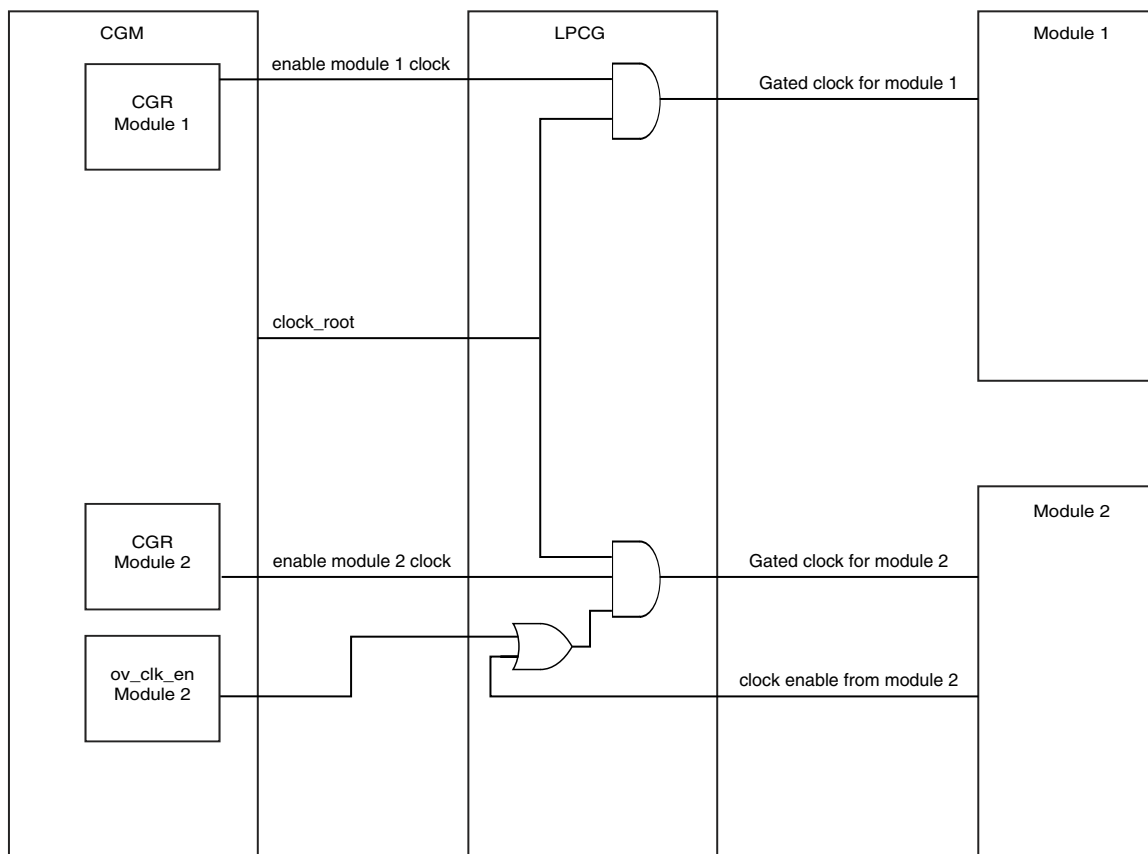

1. Clock enable signal from CCM - this signal is generated by configuration of the CGR bits in CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC spec for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

**Figure 15-9. Clock split in LPCG**

#### 15.5.1.7.1 MMDC handshake

CCM will assert the `mmdc_freq_change_req` signal.

MMDC will assert the `mmdc0_freq_change_ack` and `mmdc1_freq_change_ack` signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of `mmdc0` and/or `mmdc1` dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

Note that `mmdc0` is not used on the i.MX 6SoloLite. Therefore the user should set register `CCDR[17]` to 1 before beginning any operation that initiates a handshake. It is acceptable to program and leave this override bit asserted.

## 15.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency or CCM ARM clk divider and CPU power domain supply voltage value are controlled by the CCM\_ANALOG module. Please note that frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

Frequency shift for MMDC requires hardware support.

## 15.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

### 15.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

### 15.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits.

#### 15.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform. Gating of ARM clock will take place only if CLPCR[5]=1 and debug\_arm\_clk\_off\_on\_lpm=0 (connected to the SJC register sjc\_gpucr3\_reg bit 15). If either CLPCR[5]=0 or debug\_arm\_clk\_off\_on\_lpm=1, the ARM clocks will not be gated off and CCM will continue to the next step.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

Any enabled interrupt assertion will start the exit from WAIT mode.

### 15.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 15.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating is applied for ARM platform, GPU3D, GPU2D and VPU. External supply voltage can be reduced to decrease leakage.

#### 15.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- pmic\_vstby\_req asserted, if vstby bit is set

- osc\_en signal is negated
- osc\_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after pmic\_vstby\_req assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, anatop\_stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

### **15.5.3.3.2 Exiting STOP mode**

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If well bias was enabled, deasserted well bias controls.
3. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.
4. After the amount of CKILs defined in stby\_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
5. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
6. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
7. CCM will request GPC to restore ARM power by GPC\_PUP\_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC\_PUP\_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
8. Once assertion of notification from src that the resets for the power gated modules has been finished, (src\_power\_gating\_reset\_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals ccm\_ipg\_stop and system\_in\_stop\_mode.

## 15.6 CCM Memory Map/Register Definition

### NOTE

CCM Register reset values may not be the same in ROM. See for more information.

## 15.6.1 CCM Control Register (CCM\_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C\_4000h base + 0h offset = 20C\_4000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0				RBC_EN	REG_BYPASS_COUNT						0	WB_COUNT			
W																
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0			COSC_EN	0				OSCNT							
W																
Reset	0	0	0	1	0	1	1	0	1	1	1	1	1	1	1	1

## CCM\_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled.  1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by pmic_vstby_req. Should be zeroed and reconfigured after exit from low power mode.  REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.  000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 WB_COUNT	Well Bias counter. Delay, defined by this value, counted by CKIL clock will be applied till well bias is enabled at exit from wait or stop low power mode. Counter will be used if wb_core_at_lpm or wb_per_at_lpm bits are set. Should be zeroed and reconfigured after exit from low power mode.  000 no delay 001 1 CKIL clock delay 111 7 CKIL clocks delay
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source.  0 disable on chip oscillator 1 enable on chip oscillator
11–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7–0 OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dp1l_ip to use and only then the gate in dp1l_ip can be opened.  00000000 count 1 ckil 11111111 count 256 ckil's (default)

## 15.6.2 CCM Control Divider Register (CCM\_CCDDR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C\_4000h base + 4h offset = 20C\_4004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0														mmdc_ch0_mask	mmdc_root_mask
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CCM\_CCDDR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 mmdc_ch0_mask	During divider ratio mmdc_ch0_axi_podf change or sync mux periph_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch0 module.  0 allow handshake with mmdc_ch0 module 1 mask handshake with mmdc_ch0. Request signal will not be generated.
16 mmdc_root_mask	During divider ratio mmdc_root_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_root module.  0 allow handshake with mmdc_root module 1 mask handshake with mmdc_root. Request signal will not be generated.
15–0 Reserved	This read-only field is reserved and always has the value 0.

### 15.6.3 CCM Status Register (CCM\_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C\_4000h base + 8h offset = 20C\_4008h

CCM\_CSR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 cosc_ready	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.

Table continues on the next page...

**CCM\_CSR field descriptions (continued)**

Field	Description
	0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

**15.6.4 CCM Clock Swither Register (CCM\_CCSR)**

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C\_4000h base + Ch offset = 20C\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	pfd_540m_dis_mask	pfd_720m_dis_mask	pfd_454m_dis_mask	pfd_508m_dis_mask	pfd_594m_dis_mask	pfd_352m_dis_mask	pfd_396m_dis_mask	step_sel	0							
W													pll1_sw_clk_sel	pll2_sw_clk_sel	pll3_sw_clk_sel	
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

**CCM\_CCSR field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

**CCM\_CCSR field descriptions (continued)**

Field	Description
15 pfd_540m_dis_mask	Mask of 540M PFD auto-disable. 0 - 540M PFD disable=0 (PFD always on) 1 540M PFD disable is managed by associated dividers disable. If all 540M-driven dividers are closed, PFD is disabled.
14 pfd_720m_dis_mask	Mask of 720M PFD auto-disable. 0 720M PFD disable=0 (PFD always on) 1 720M PFD disable is managed by associated dividers disable. If all 720M-driven dividers are closed, PFD is disabled.
13 pfd_454m_dis_mask	Mask of 454M PFD auto-disable. 0 454M PFD disable=0 (PFD always on) 1 454M PFD disable is managed by associated dividers disable. If all 454M-driven dividers are closed, PFD is disabled.
12 pfd_508m_dis_mask	Mask of 508M PFD auto-disable. 0 508M PFD disable=0 (PFD always on) 1 508M PFD disable is managed by associated dividers disable. If all 508M-driven dividers are closed, PFD is disabled.
11 pfd_594m_dis_mask	Mask of 594M PFD auto-disable. 0 594M PFD disable=0 (PFD always on) 1 594M PFD disable is managed by associated dividers disable. If all 594M-driven dividers are closed, PFD is disabled.
10 pfd_352m_dis_mask	Mask of 352M PFD auto-disable. 0 352M PFD disable=0 (PFD always on) 1 352M PFD disable is managed by associated dividers disable. If all 352M-driven dividers are closed, PFD is disabled.
9 pfd_396m_dis_mask	Mask of 396M PFD auto-disable. 0 396M PFD disable=0 (PFD always on) 1 396M PFD disable is managed by associated dividers disable. If all 396M-driven dividers are closed, PFD is disabled.
8 step_sel	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk.  <b>NOTE:</b> This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used.  0 osc_clk (24M) - source for lp_apm. (default) 1 pll2 PFD clock
7-3 Reserved	This read-only field is reserved and always has the value 0.
2 pll1_sw_clk_sel	Selects source to generate pll1_sw_clk. 0 pll1_main_clk(default) 1 step_clk

*Table continues on the next page...*

## CCM\_CCSR field descriptions (continued)

Field	Description
1 pll2_sw_clk_sel	Selects source to generate pll2_sw_clk. This bit should only be used for testing purposes. 0 pll2_main_clk(default) 1 pll2 bypass clock
0 pll3_sw_clk_sel	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk(default) 1 pll3 bypass clock

## 15.6.5 CCM Arm Clock Root Register (CCM\_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C\_4000h base + 10h offset = 20C\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

12–10 ahb_podf	<p>Divider for AHB PODF.</p> <p><b>NOTE:</b> Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits.</p> <p>000    divide by 1</p> <p>001    divide by 2</p> <p>010    divide by 3</p> <p>011    divide by 4</p> <p>100    divide by 5</p> <p>101    divide by 6</p> <p>110    divide by 7</p> <p>111    divide by 8</p>
9–8 ipg_podf	<p>Divider for ipg podf.</p> <p><b>NOTE:</b> IEEE_RTC module will not support ratio of 1:3 for ahb_clk:ipg_clk. In case IEEE_RTC is used, then those ratios should not be used.</p> <p><b>NOTE:</b> SDMA module will not support ratio of 1:3 and 1:4 for ahb_clk:ipg_clk. In case SDMA is used, then those ratios should not be used.</p> <p>00    divide by 1</p> <p>01    divide by 2</p> <p>10    divide by 3</p> <p>11    divide by 4</p>
7 ocram_alt_clk_sel	<p>OCRAM alternative clock select</p> <p>0    pll2 396MHz PFD will be selected as alternative clock for OCRAM root clock</p> <p>1    pll3 540MHz PFD will be selected as alternative clock for OCRAM root clock</p>

Table continues on the next page...

**CCM\_CBCDR field descriptions (continued)**

Field	Description
6 ocram_clk_sel	OCRAM clock source select 0 Periph_clk output will be used as OCRAM clock root 1 AXI alternative clock will be used as OCRAM clock root
5–3 fabric_mmdc_podf	Post divider for fabric_mmdc clock. <b>NOTE:</b> This design implementation does not use MMDC_ROOT_AXI_CLK_ROOT as a clock source to the MMDC. Only MMDC_CH0_AXI_CLK_ROOT is used.  000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
2–0 periph2_clk2_podf	Divider for periph2_clk2 podf. <b>NOTE:</b> Divider should be updated when output clock is gated.  000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

**15.6.7 CCM Bus Clock Multiplexer Register (CCM\_CBCMR)**

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

**NOTE**

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm\_clk\_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

### 15.6.17 CCM Divider Handshake In-Process Register (CCM\_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 20C\_4000h base + 48h offset = 20C\_4048h

CCM\_CDHIPR field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 arm_podf_busy	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 periph_clk_sel_busy	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 mmdc_ch0_axi_podf_busy	Busy indicator for mmdc_ch0_axi_podf.

Table continues on the next page...

**CCM\_CDHIPR field descriptions (continued)**

Field	Description
	0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value odivision factor, and after the handshake the written value of the mmdc_ch0_axi_podf will be applied.
3 periph2_clk_sel_busy	Busy indicator for periph2_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.
2 mmdc_root_podf_busy	Busy indicator for mmdc_root_axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value odivision factor, and after the handshake the written value of the mmdc_root_axi_podf will be applied.
1 ahb_podf_busy	Busy indicator for ahb_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value odivision factor, and after the handshake the written value of the ahb_podf will be applied.
0 axi_podf_busy	Busy indicator for axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value odivision factor, and after the handshake the written value of the axi_podf will be applied.

## 15.6.18 CCM Low Power Control Register (CCM\_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 20C\_4000h base + 54h offset = 20C\_4054h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0				mask_l2cc_idle	mask_scu_idle	0			mask_core0_wfi	bypass_mmdc_root_lpm_hs	0	bypass_mmdc_ch0_lpm_hs	0	Reserved	wb_per_at_lpm
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0				cosc_pwrdown	stby_count		VSTBY	dis_ref_osc	SBYOS	ARM_clk_dis_on_lpm	Reserved		bypass_pmic_ready	LPM	
W																
Reset	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1

**CCM\_CLPCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 mask_l2cc_idle	Mask L2CC IDLE for entering low power mode. <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 mask_scu_idle	Mask SCU IDLE for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

## CCM\_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 mask_core0_wfi	Mask WFI of core0 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 bypass_mmdc_root_lpm_hs	Bypass handshake with mmdc_root on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake also will be bypassed, if CGR3 CG10 is set to gate fast mmdc_root clock. 0 handshake with mmdc_root on next entrance to low power mode will be performed. (default). 1 handshake with mmdc_root on next entrance to low power mode will be bypassed.
20 Reserved	This read-only field is reserved and always has the value 0.
19 bypass_mmdc_ch0_lpm_hs	Bypass handshake with mmdc_ch0 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake will also be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch0 clock. 0 Handshake with mmdc_ch0 on next entrance to low power mode will be performed. (default). 1 Handshake with mmdc_ch0 on next entrance to low power mode will be bypassed.
18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. Reserved
16 wb_per_at_lpm	Enable periphery charge pump for well biasing at low power mode (stop or wait) 0 Periphery charge pump won't be enabled at STOP or WAIT low power modes 1 Periphery charge pump will be enabled at STOP or WAIT low power modes
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 cosc_pwrdown	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed.  The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'.(default) 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 stby_count	Standby counter definition. These two bits define, in the case of stop exit (if vstby bit was set), the amount of time CCM will wait between PMIC_VSTBY_REQ negation and the check of assertion of CCM_PMIC_READY . <b>NOTE:</b> Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles

Table continues on the next page...

## CCM\_CLPCR field descriptions (continued)

Field	Description
8 VSTBY	<p>Voltage standby request bit. This bit defines if PMIC_VSTBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode.</p> <p>0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_VSTBY_REQ will remain negated - '0')</p> <p>1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_VSTBY_REQ will be asserted - '1').</p>
7 dis_ref_osc	<p>dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed.</p> <p>The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation.</p> <p><b>NOTE:</b> When returning from stop mode, the PMIC_VSTBY_REQ will be deasserted (if it was asserted when entering stop mode), and CCM will wait for indication that functional voltage is ready (by sampling the assertion of pmic_vfunctional_ready) before continuing the process of exiting from stop mode. See stby_count bits.</p> <p>0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'.(default)</p> <p>1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'</p>
6 SBYOS	<p>Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator.</p> <p>0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0')</p> <p>1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). (Default.) When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.</p>
5 ARM_clk_dis_on_lpm	<p>Define if ARM clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning.</p> <p><b>NOTE:</b> Software should not enable ARM power gating in wait mode if this bit is cleared.</p> <p>0 ARM clock enabled on wait mode.</p> <p>1 ARM clock disabled on wait mode. (default).</p>
4-3 -	<p>This field is reserved. Reserved</p>
2 bypass_pmic_ready	<p>By asserting this bit CCM will bypass waiting for CCM_PMIC_READY signal when coming out of STOP mode. This should be used for PMIC's that don't support the CCM_PMIC_READY signal.</p> <p>0 Don't bypass the CCM_PMIC_READY signal - CCM will wait for it's assertion during exit of low power mode if standby voltage was enabled.</p> <p>1 bypass the CCM_PMIC_READY signal - CCM will not wait for it's assertion during exit of low power mode if standby voltage was enabled.</p>
1-0 LPM	<p>Setting the low power mode that system will enter on next assertion of dsm_request signal.</p> <p>00 Remain in run mode</p> <p>01 Transfer to wait mode</p> <p>10 Transfer to stop mode</p> <p>11 Reserved</p>

15.6.19 CCM Interrupt Status Register (CCM\_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

Address: 20C\_4000h base + 58h offset = 20C\_4058h

## CCM Memory Map/Register Definition

### CCM\_CIMR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 1.
26 arm_podf_loaded	mask interrupt generation due to frequency change of arm_podf 0 don't mask interrupt due to frequency change of arm_podf - interrupt will be created 1 mask interrupt due to frequency change of arm_podf
25–24 Reserved	This read-only field is reserved and always has the value 1.
23 mask_mmdc_ch0_podf_loaded	mask interrupt generation due to update of mask_mmdc_ch0_podf 0 don't mask interrupt due to update of mask_mmdc_ch0_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_ch0_podf
22 mask_periph_clk_sel_loaded	mask interrupt generation due to update of periph_clk_sel. 0 don't mask interrupt due to update of periph_clk_sel - interrupt will be created 1 mask interrupt due to update of periph_clk_sel
21 mask_mmdc_root_podf_loaded	mask interrupt generation due to update of mask_mmdc_root_podf 0 don't mask interrupt due to update of mask_mmdc_root_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_root_podf

Table continues on the next page...

**CCM\_CIMR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
20 mask_ahb_podf_loaded	mask interrupt generation due to frequency change of ahb_podf 0 don't mask interrupt due to frequency change of ahb_podf - interrupt will be created 1 mask interrupt due to frequency change of ahb_podf
19 mask_periph2_clk_sel_loaded	mask interrupt generation due to update of periph2_clk_sel. 0 don't mask interrupt due to update of periph2_clk_sel - interrupt will be created 1 mask interrupt due to update of periph2_clk_sel
18 mask_mmdc_ch0_axi_podf_loaded	mask interrupt generation due to frequency change of mmdc_ch0_axi_podf 0 don't mask interrupt due to frequency change of mmdc_ch0_axi_podf - interrupt will be created 1 mask interrupt due to frequency change of mmdc_ch0_axi_podf
17 mask_axi_podf_loaded	mask interrupt generation due to frequency change of axi_podf 0 don't mask interrupt due to frequency change of axi_podf - interrupt will be created 1 mask interrupt due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 1.
6 mask_cosc_ready	mask interrupt generation due to on board oscillator ready 0 don't mask interrupt due to on board oscillator ready - interrupt will be created 1 mask interrupt due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 1.
0 mask_lrf_pll	mask interrupt generation due to lrf of PLLs 0 don't mask interrupt due to lrf of PLLs - interrupt will be created 1 mask interrupt due to lrf of PLLs

## 15.6.21 CCM Clock Output Source Register (CCM\_CCOSR)

The figure below represents the CCM Clock Output Source Register (CCOSR). The CCOSR register contains bits to control the clock that will be generated on the output ipp\_do\_clk01 (CCM\_CLKO). The table below provides its field descriptions.

Address: 20C\_4000h base + 60h offset = 20C\_4060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W															1	
Reset	1	1	1	1	1	1	1	0	0	1	1	0	0	0	1	0

**CCM\_CGPR field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 FPL	Fast PLL enable.  0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 efuse_prog_ supply_gate	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing  0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing.
3 -	This field is reserved. Reserved
2 mmdc_ext_clk_ dis	Disable external clock driver of MMDC during STOP mode  1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 pmic_delay_ scaler	Defines clock division of clock for stby_count (pmic delay counter)  0 clock is not divided 1 clock is divided /8

**15.6.23 CCM Clock Gating Register 0 (CCM\_CCGR0)**

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM\_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C\_4000h base + 68h offset = 20C\_4068h

19–18 CG9	ssi1 clocks (ssi1_clk_enable)
17–16 CG8	Reserved
15–14 CG7	spdif clock (spdif_clk_enable)
13–12 CG6	spba clock (spba_clk_enable)
11–10 CG5	Reserved
9–8 CG4	Reserved
7–6 CG3	sdma clock (sdma_clk_enable)
5–4 CG2	100M clock (100M_clk_enable)
3–2 CG1	Reserved
1–0 CG0	rom clock (rom_clk_enable)

## 15.6.29 CCM Clock Gating Register 6 (CCM\_CCGR6)

The figure below represents the CCM Clock Gating Register 6 (CCM\_CCGR6). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 8 CGR registers. The number of registers required is determined by the number of peripherals in the system.

Address: 20C\_4000h base + 80h offset = 20C\_4080h

3–2 CG1	usdhc1 clocks (usdhc1_clk_enable)
1–0 CG0	usboh3 clock (usboh3_clk_enable)

**15.6.30 CCM Module Enable Override Register (CCM\_CMEOR)**

The follow figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit will be applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 20C\_4000h base + 88h offset = 20C\_4088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**CCM\_CMEOR field descriptions**

Field	Description
31–11 Reserved	This read-only field is reserved and always has the value 1.
10 mod_en_ov_gpu2d	Override clock enable signal from GPU2D - clock will not be gated based on GPU2D's signal 'gpu2d_busy'.

*Table continues on the next page...*

**CCM\_CMEOR field descriptions (continued)**

Field	Description
	0 don't override module enable signal 1 override module enable signal
9–8 Reserved	This read-only field is reserved and always has the value 1.
7 mod_en_usdhc	override clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 mod_en_ov_epit	Override clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 mod_en_ov_gpt	Override clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
4–0 Reserved	This read-only field is reserved and always has the value 1.

## 15.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

## 15.7.1 Analog ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 20C\_8000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16								
R	LOCK								-								PLL_SEL		LVDS_24MHZ_SEL		LVDS_SEL		BYPASS	
W																								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1							

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	BYPASS_CLK_SRC		ENABLE	POWERDOWN	Reserved				DIV_SELECT							
W																
Reset	0	0	1	1	0	0	0	0	0	1	0	0	0	0	1	0

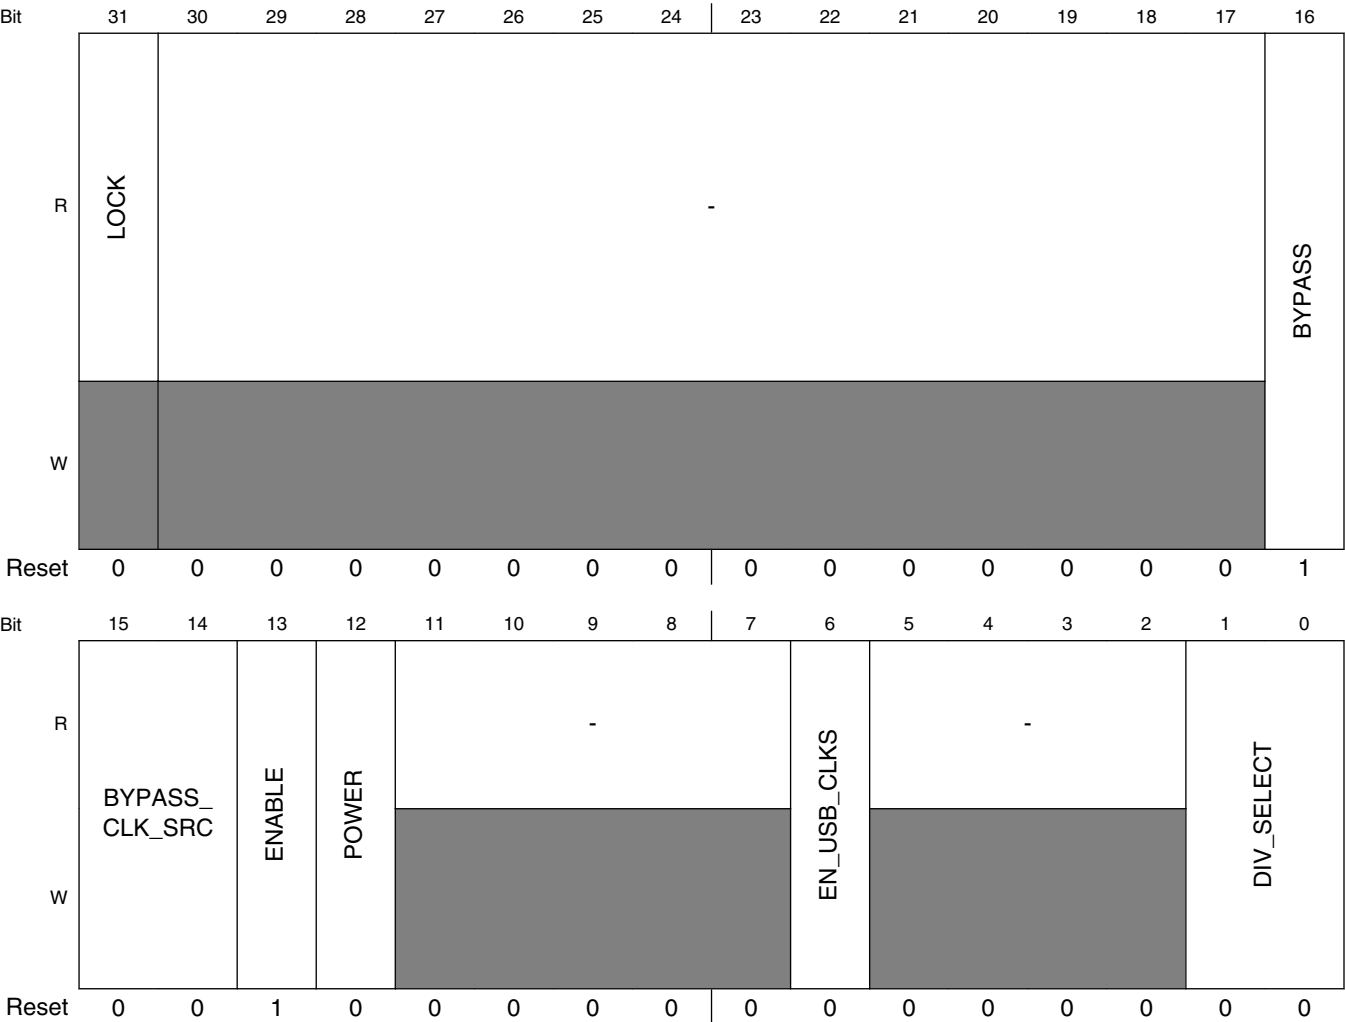

**CCM\_ANALOG\_PLL\_ARMn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved
18 LVDS_24MHZ_SEL	Analog Debug Bit
17 LVDS_SEL	Analog Debug Bit
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–0 DIV_SELECT	This field controls the pll loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div\_select / 2.0$ .

### 15.7.2 Analog USB1 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C\_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM\_ANALOG\_PLL\_USB1n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the pll.

Table continues on the next page...

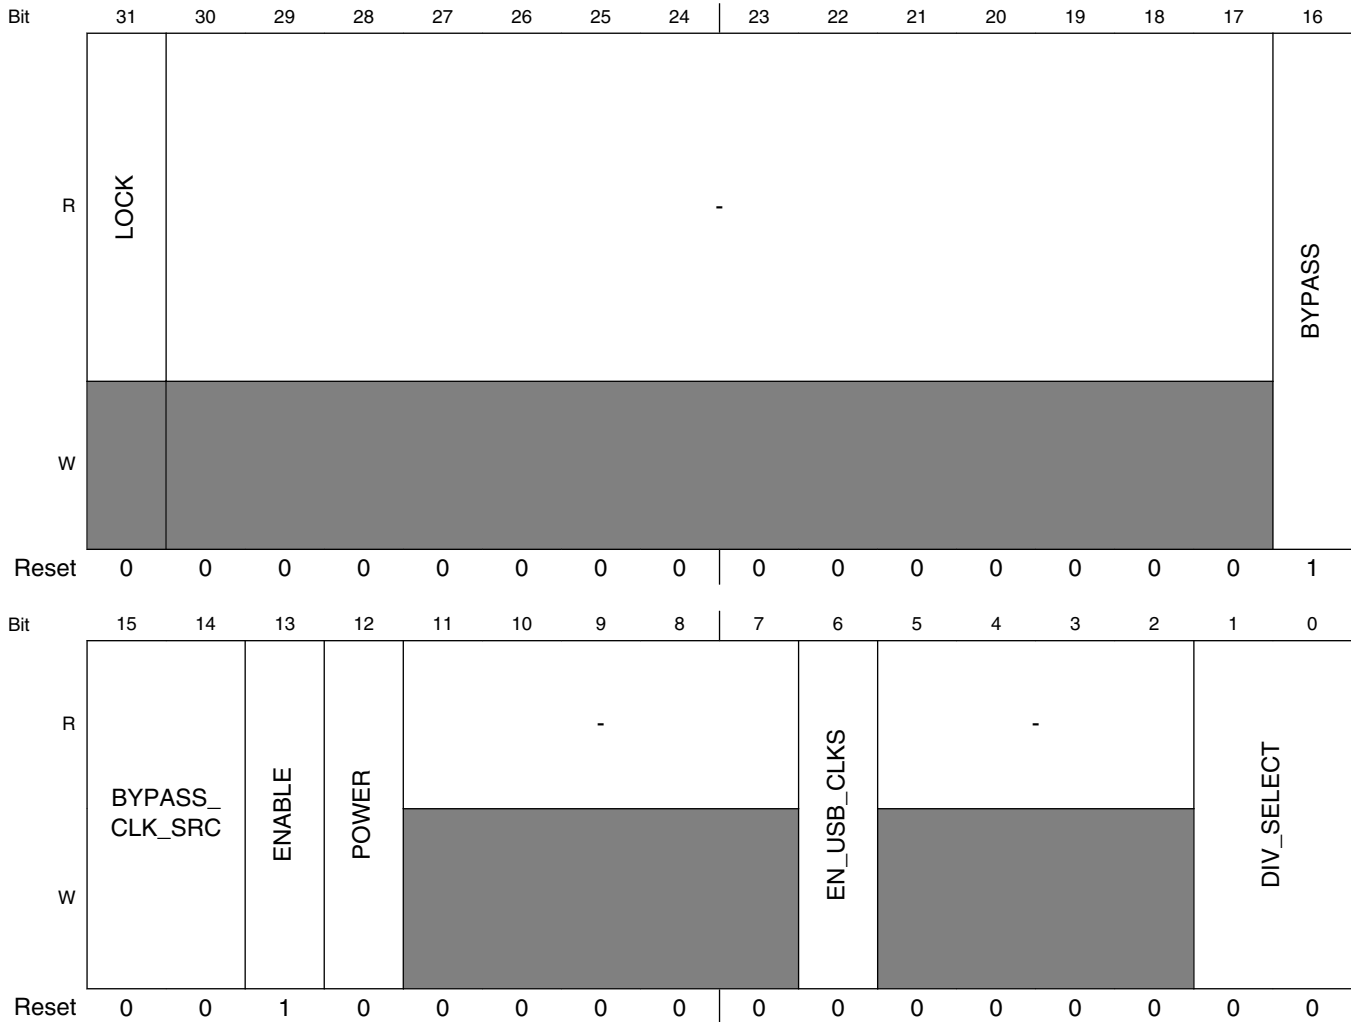

**CCM\_ANALOG\_PLL\_USB1<sub>n</sub> field descriptions (continued)**

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>GPANAIO</b> — 0x3 <b>CHRG_DET_B</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHY <sub>n</sub> . Additionally, the UTMI clock gate must be deasserted in the USBPHY <sub>n</sub> to enable USB <sub>n</sub> operation (clear CLKGATE bit in USBPHY <sub>n</sub> _CTRL). This bit will be set automatically when USBPHY <sub>n</sub> remote wakeup event occurs.  0 PLL outputs for USBPHY <sub>n</sub> off. 1 PLL outputs for USBPHY <sub>n</sub> on.
5–2 -	Always set to zero (0).
1–0 DIV_SELECT	This field controls the pll loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 15.7.3 Analog USB2 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C\_8000h base + 20h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_USB2n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the pll.

*Table continues on the next page...*

**CCM\_ANALOG\_PLL\_USB2n field descriptions (continued)**

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
1–0 DIV_SELECT	This field controls the pll loop divider. 0 - $F_{out}=F_{ref}*20$ ; 1 - $F_{out}=F_{ref}*22$ .

#### 15.7.4 Analog System PLL Control Register (CCM\_ANALOG\_PLL\_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C\_8000h base + 30h offset + (4d × i), where i=0d to 3d

Register 0: LOCK, PFD\_OFFSET\_EN, Reserved, BYPASS. Bit 31 is LOCK (R). Bits 18-17 are PFD\_OFFSET\_EN (R). Bits 16-15 are Reserved (R). Bit 14 is BYPASS (R).

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_SYSn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>GPANAIO</b> — 0x3 <b>CHRG_DET_B</b> —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the pll loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 15.7.5 Analog Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDION)

The control register provides control for the audio PLL.

Address: 20C\_8000h base + 70h offset + (4d × i), where i=0d to 3d

[illegible]

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_AUDION field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 SSC_EN	Reserved Bit
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —

Table continues on the next page...

**CCM\_ANALOG\_PLL\_AUDIO<sub>n</sub> field descriptions (continued)**

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–0 DIV_SELECT	This field controls the pll loop divider. Valid range for DIV_SELECT divider value: 27~54.

**15.7.6 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)**

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C\_8000h base + 80h offset = 20C\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_AUDIO\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
29–0 A	30 bit numerator of fractional loop divider.

### 15.7.7 Denominator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C\_8000h base + 90h offset = 20C\_8090h

CCM\_ANALOG\_PLL\_AUDIO\_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
29–0 B	30 bit Denominator of fractional loop divider.

### 15.7.8 Analog Video PLL control Register (CCM\_ANALOG\_PLL\_VIDEO*n*)

The control register provides control for the Video PLL.

Address: 20C\_8000h base + A0h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_VIDEOn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 SSC_EN	Reserved Bit
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —

Table continues on the next page...

**CCM\_ANALOG\_PLL\_VIDEO<sub>n</sub> field descriptions (continued)**

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–0 DIV_SELECT	This field controls the pll loop divider. Valid range for DIV_SELECT divider value: 27~54.

**15.7.9 Numerator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_NUM)**

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C\_8000h base + B0h offset = 20C\_80B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_VIDEO\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
29–0 A	30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator

### 15.7.10 Denominator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider.  
(Unsigned number)

Address: 20C\_8000h base + C0h offset = 20C\_80C0h

CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
29–0 B	30 bit Denominator of fractional loop divider.

### 15.7.11 Analog ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENETn)

The control register provides control for the ENET PLL.

Address: 20C\_8000h base + E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK											ENABLE_100M	ENABLE_125M	PFD_OFFSET_EN	Reserved	BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_ENETn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–21 -	Always set to zero (0).
20 ENABLE_100M	Enables an offset in the phase frequency detector.
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —
13 ENABLE	Enable the ethernet clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_ENET<sub>n</sub> field descriptions (continued)**

Field	Description
6–2 -	Always set to zero (0).
1–0 DIV_SELECT	Controls the frequency of the ethernet reference clock. 00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz;

### 15.7.12 480MHz Clock (from PLL\_USB2) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_480<sub>n</sub>)

The PFD\_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C\_8000h base + F0h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PFD\_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

**CCM\_ANALOG\_PFD\_480n field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12–35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
5–0 PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12–35.

**15.7.13 528MHz Clock (From PLL\_SYS) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_528n)**

The PFD\_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address:  $20C\_8000h \text{ base} + 100h \text{ offset} + (4d \times i)$ , where  $i=0d \text{ to } 3d$

## CCM Analog Memory Map/Register Definition

13 REG1_ENABLE_ BO	Enables the brownout detection. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information.
12 -	This field is reserved.
11 REG1_BO_ STATUS	Reg1 brownout status bit. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information. 1 Brownout, supply is below target minus brownout offset.
10–8 REG1_BO_ OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information. 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
7 PLL3_disable	Default value of "0". Should be set to "1" to turn off the USB-PLL(PLL3) in run mode.
6 -	This field is reserved.
5 REG0_ENABLE_ BO	Enables the brownout detection. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information.
4 -	This field is reserved.
3 REG0_BO_ STATUS	Reg0 brownout status bit. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information. 1 Brownout, supply is below target minus brownout offset.
2–0 REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> for more information. 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

# Chapter 16

## CMOS Sensor Interface (CSI)

### 16.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCbCr, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 32-bit receive FIFO packing.
- 128 x 32 FIFO to store received image pixel data.
- Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.

- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

## 16.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

**Table 16-1. CSI External Signals**

Signal	Description	Pad	Mode	Direction
CSI_DATA00	Data Sensor Signal 0, part of 16-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	EPDC_D0	ALT3	I
		LCD_DAT17	ALT2	
		SD2_CLK	ALT3

## 16.3 Clocks

The following table describes the clock sources for CSI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 16-2. CSI Clocks**

Clock name	Clock Root	Description
csi_hclk	ahb_clk_root	Module clock
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_s_raw	ipg_clk_root	Peripheral raw data clock

## 16.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI\_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI\_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI\_DATA[15:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI\_DATA[7:0] and CSI\_DATA[15:8].

### 16.4.1 Data Transfer With The Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the RxFIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1

and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in word and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF\_PARA register, the user should set the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. In the CSIMAG\_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF\_LEVEL and DMA\_REQ\_EN\_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the Rx FIFO reaches the trigger level, a DMA request will be sent to the embedded DMA controller and the data will be read out from the Rx FIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA\_TSF\_DONE\_FB1 or DMA\_TSF\_DONE\_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA\_REFLASH\_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The Rx FIFO has the overrun protection mechanism in case the Rx FIFO is overrun during data transfer. If the Rx FIFO is full and more data needs to be received during the data transfer, the Rx FIFO will be overwritten continuously and all 128 words of data in the Rx FIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the external memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in word and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF\_LEVEL and DMA\_REQ\_EN\_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA\_TSF\_DONE\_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF\_DMA\_DONE\_INTEN is enabled in CSICR1 register. The DMA\_REFLASH\_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

## 16.4.2 Gated Clock Mode

VSYN, HSYN, and PIXCLK signals are used in gated clock mode.

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

### 16.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

**Figure 16-1. Non-Gated Clock Mode Timing Diagram**

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into RxFIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.

Figure 16-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programmed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

### 16.4.4 CCIR656 Interlace Mode

In CCIR656 mode, only the PIXCLK and CSI\_DATA[13:6] signals are used. The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical

block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering—that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

Figure below describes the frame structure in PAL system, showing vertical and horizontal blanking.

Figure 16-2. CCIR656 Interlace Mode (PAL)

Figure below describes the general timing for a single line, showing SAV and EAV.

Figure 16-3. CCIR656 General Line Timing

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

**Table 16-3. Coding for SAV and EAV**

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

**Table 16-4. Codes with Protection bits for Error Detection/Correction**

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

**Table 16-5. Representations by F-Bit**

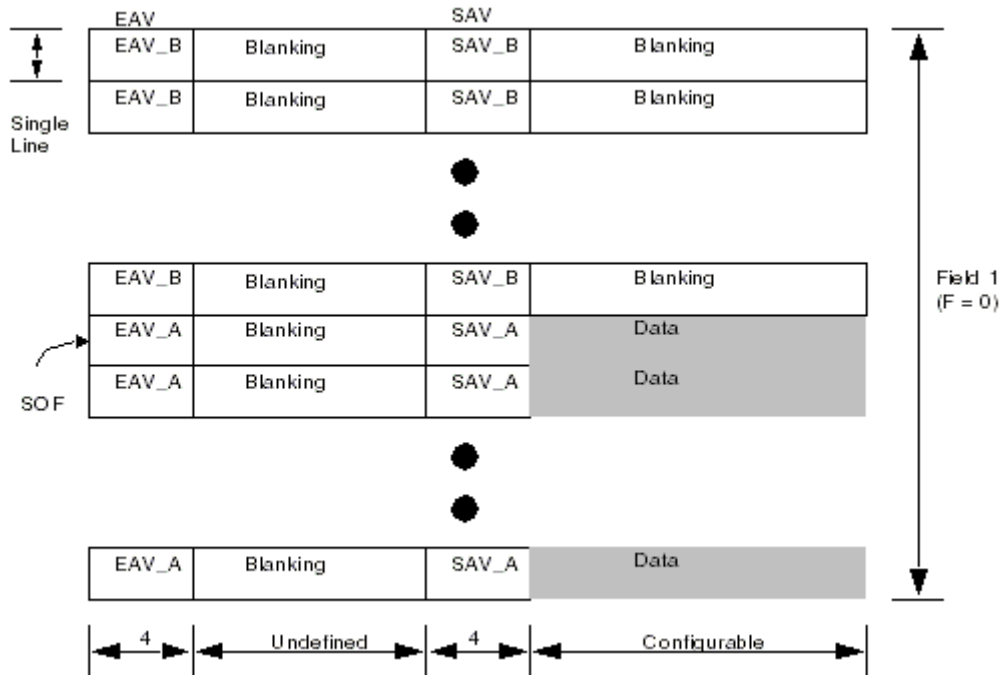

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

### 16.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

Figure below shows the typical flow of progressive mode.

**Figure 16-4. CCIR656 Progressive Mode (General Case)**

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

### 16.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

## 16.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

### 16.5.1 Start Of Frame Interrupt (SOF\_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF\_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF\_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

### 16.5.2 End Of Frame Interrupt (EOF\_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

### 16.5.3 Change Of Field Interrupt (COF\_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF\_INT bit in the CSI Status Register (CSISTAT) before checking that F1\_INT or F2\_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

#### **16.5.4 CCIR Error Interrupt (ECC\_INT)**

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC\_INT status bit is set.

#### **16.5.5 RxFIFO Full Interrupt (RxFF\_INT)**

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF\_LEVEL in CSICR3.

#### **16.5.6 Statistic FIFO Full Interrupt (STATFF\_INT)**

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF\_LEVEL in CSICR3.

#### **16.5.7 RxFIFO Overrun Interrupt (RFF\_OR\_INT)**

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

#### **16.5.8 Statistic FIFO Overrun Interrupt (SFF\_OR\_INT)**

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

#### **16.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB1)**

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

### **16.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB2)**

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

### **16.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_SFF)**

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

### **16.5.12 AHB Bus Response Error Interrupt (HRESP\_ERR\_INT)**

An AHB Bus response error interrupt is generated when a bus error is detected.

## **16.6 Data Packing Style**

Careful attention to endianness is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK\_DIR and the SWAP16\_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring PIXEL\_BIT bit in CSI Control Register 1 (CSICR1) and TWO\_8BIT\_SENSOR bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of PACK\_DIR bit. The packed data is stored in the RX FIFO according to the setting of the SWAP16\_EN bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the CSI\_DATA[7:0]. The other sensor is connected to CSI\_DATA[15:8].

## 16.6.1 RX FIFO Path

### 16.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the `PACK_DIR` bit should be set to 0. 8-bit data format from a sensor is packed to 32 bits as `P3.P2.P1.P0`, where `P0` is the pixel coming in time slot 0 (first data) and `P3` is the pixel coming in time slot 3 (the last data in the 32-bit word). When the data is addressed as bytes by software, `P0` is transferred first, `P1` is transferred next, and so on. 10-bit data format is packed to 32 bits as `000000.P1.000000.P0`, where `P0` is the 10-bit data coming in time slot 0 (first pixel) and `P1` is the 10-bit data coming in time slot 1 (second pixel). 16-bit data, from two sensors, is packed to 32 bits as `P3.P2.P1.P0`, where `P0` and `P1` are the two 8-bit data coming in time slot 0 (`P0` is the first pixel of the sensor connected with `CSI_DATA[7:0]` and `P1` is the first pixel of the sensor connected with `CSI_DATA[15:8]`). `P2` and `P3` are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

### 16.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as `P0` first, followed by `P1`, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled `RG`, and the LSB labeled `GB`. `P0` is represented as `RG0` and `GB0`.

CSI receives data in one of the following sequence:

- `RG0, GB0, RG1, GB1`, while `RG0` comes out at time slot 0 (first data), and `GB1` comes out at time slot 3 (last data)
- `GB0, RG0, GB1, RG1`

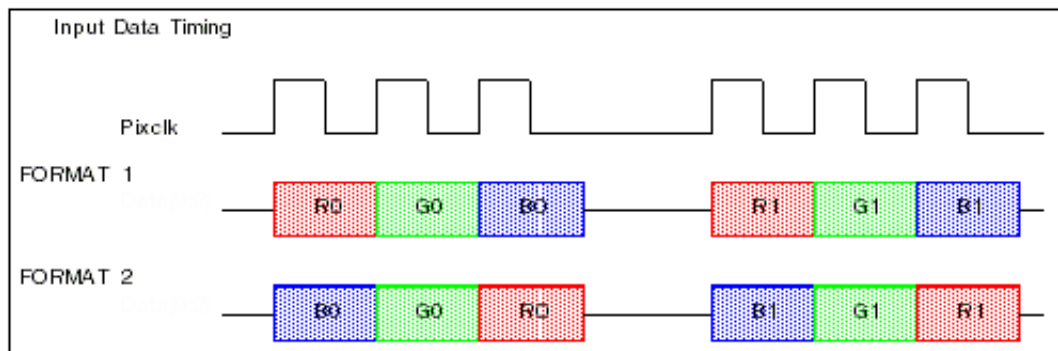

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

- 8-bit data from sensor: `RG0, GB0, RG1, GB1, ...`
- 32-bit data before storage in the CSI RX FIFO (`PACK_DIR` bit = 1):  
`RG0GB0RG1GB1`
- 32-bit data in CSI RX FIFO (`SWAP16_EN` bit enabled): `RG1GB1RG0GB0`

- 32-bit transfer to system memory: RG1GB1RG0GB0
- 16-bit read by display controller: RG0GB0, RG1GB1

### 16.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the figure below.

**Figure 16-5. Sample Timing Diagram for RGB888 Data**

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the figure below. The dummy zero is always packed at the LSB position.

## 16.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI\_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK\_DIR and SWAP16\_EN bits in the CSICR1 register have no effect on the input path. The PACK\_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK\_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

...

When the PACK\_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

## 16.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

**CSI memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_4000	CSI Control Register 1 (CSI_CSICR1)	32	R/W	4000_0800h	<a href="#">16.7.1/625</a>
20E_4004	CSI Control Register 2 (CSI_CSICR2)	32	R/W	0000_0000h	<a href="#">16.7.2/629</a>
20E_4008	CSI Control Register 3 (CSI_CSICR3)	32	R/W	0000_0000h	<a href="#">16.7.3/631</a>
20E_400C	CSI Statistic FIFO Register (CSI_CSISTATFIFO)	32	R	0000_0000h	<a href="#">16.7.4/633</a>
20E_4010	CSI RX FIFO Register (CSI_CSIRFIFO)	32	R	0000_0000h	<a href="#">16.7.5/634</a>
20E_4014	CSI RX Count Register (CSI_CSIRXCNT)	32	R/W	0000_9600h	<a href="#">16.7.6/634</a>
20E_4018	CSI Status Register (CSI_CSISR)	32	R/W	0000_4000h	<a href="#">16.7.7/635</a>

*Table continues on the next page...*

## CSI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_4020	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO)	32	R/W	0000_0000h	<a href="#">16.7.8/638</a>
20E_4024	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO)	32	R/W	0000_0000h	<a href="#">16.7.9/638</a>

## 16.7.1 CSI Control Register 1 (CSI\_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

Address: 20E\_4000h base + 0h offset = 20E\_4000h

## CSI\_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	<p>SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO.</p> <p><b>NOTE:</b> Example of swapping enabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x 33441122</p> <p><b>NOTE:</b> Example of swapping disabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x11223344</p> <p>0   Disable swapping 1   Enable swapping</p>
30 EXT_VSYNC	<p>External VSYNC Enable. This bit controls the operational VSYNC mode.</p> <p><b>NOTE:</b> This only works when the CSI is in CCIR progressive mode.</p> <p>0   Internal VSYNC mode 1   External VSYNC mode</p>
29 EOF_INT_EN	<p>End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt.</p> <p>0   EOF interrupt is disabled. 1   EOF interrupt is generated when RX count value is reached.</p>
28 PrP_IF_EN	<p>CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked.</p> <p>0   CSI to PrP bus is disabled 1   CSI to PrP bus is enabled</p>
27 CCIR_MODE	<p>CCIR Mode Select. This bit controls the CCIR mode of operation.</p> <p>This bit only works in CCIR interface mode.</p> <p>0   Progressive mode is selected 1   Interlace mode is selected</p>
26 COF_INT_EN	<p>Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt.</p> <p>This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1.</p> <p>0   COF interrupt is disabled 1   COF interrupt is enabled</p>
25 SF_OR_INTEN	<p>STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt.</p> <p>0   STATFIFO overrun interrupt is disabled 1   STATFIFO overrun interrupt is enabled</p>
24 RF_OR_INTEN	<p>RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt.</p> <p>0   RxFIFO overrun interrupt is disabled 1   RxFIFO overrun interrupt is enabled</p>

*Table continues on the next page...*

**CSI\_CSICR1 field descriptions (continued)**

Field	Description
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_ DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done.  0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt.  0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable
20 FB2_DMA_ DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done.  0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_ DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done.  0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt.  0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt.  0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt.  0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved. This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC. This bit only works in gated-clock-that is, GCLK_MODE = 1 and CCIR_EN = 0.  0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic.  0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.

*Table continues on the next page...*

**CSI\_CSICR1 field descriptions (continued)**

Field	Description
8 FCC	<p>FIFO Clear Control. This bit determines how the RXFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RXFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RXFIFO and CLR_STATFIFO bits.</p> <p>0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.</p>
7 PACK_DIR	<p>Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO.</p> <p>0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0BBBBB, it will appear as 0BBBBBAAAA in STAT FIFO. 1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0BBBBB, it will appear as 0AAAAABBBB in STAT FIFO.</p>
6 CLR_STATFIFO	<p>Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
5 CLR_RXFIFO	<p>Asynchronous RXFIFO Clear. This bit clears the RXFIFO.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
4 GCLK_MODE	<p>Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode.</p> <p>This bit works only in traditional mode-that is, CCIR_EN = 0. Otherwise this bit is ignored.</p> <p>0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored. 1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.</p>
3 INV_DATA	<p>Invert Data Input. This bit enables or disables internal inverters on the data lines.</p> <p>0 CSI_D[7:0] data lines are directly applied to internal circuitry 1 CSI_D[7:0] data lines are inverted before applied to internal circuitry</p>
2 INV_PCLK	<p>Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module.</p> <p>0 CSI_PIXCLK is directly applied to internal circuitry 1 CSI_PIXCLK is inverted before applied to internal circuitry</p>
1 REDGE	<p>Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data.</p> <p>0 Pixel data is latched at the falling edge of CSI_PIXCLK 1 Pixel data is latched at the rising edge of CSI_PIXCLK</p>
0 PIXEL_BIT	<p>Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller.</p> <p>0 8-bit data for each pixel 1 10-bit data for each pixel</p>

## 16.7.2 CSI Control Register 2 (CSI\_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: 20E\_4000h base + 4h offset = 20E\_4004h

**CSI\_CSICR2 field descriptions (continued)**

Field	Description
27 -	This field is reserved. Reserved. These bit is reserved and should read 0.
26 DRM	Double Resolution Mode. Controls size of statistics grid.  0 Stats grid of 8 x 6 1 Stats grid of 8 x 12
25–24 AFS	Auto Focus Spread. Selects which green pixels are used for auto-focus.  00 Abs Diff on consecutive green pixels 01 Abs Diff on every third green pixels 1x Abs Diff on every four green pixels
23 SCE	Skip Count Enable. Enables or disables the skip count feature.  0 Skip count disable 1 Skip count enable
22–21 -	This field is reserved. Reserved. These bits are reserved and should read 0.
20–19 BTS	Bayer Tile Start. Controls the Bayer pattern starting point.  00 GR 01 RG 10 BG 11 GB
18–16 LVRM	Live View Resolution Mode. Selects the grid size used for live view resolution.  0 512 x 384 1 448 x 336 2 384 x 288 3 384 x 256 4 320 x 240 5 288 x 216 6 400 x 300
15–8 VSC	Vertical Skip Count. Contains the number of rows to skip. SCE must be 1, otherwise VSC is ignored.  0-255 Number of rows to skip minus 1
7–0 HSC	Horizontal Skip Count. Contains the number of pixels to skip. SCE must be 1, otherwise HSC is ignored.  0-255 Number of pixels to skip minus 1

### 16.7.3 CSI Control Register 3 (CSI\_CSICR3)

This read/write register acts as an extension of the functionality of the CSI Control register 1, adding additional control and features.

Address: 20E\_4000h base + 8h offset = 20E\_4008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### CSI\_CSICR3 field descriptions

Field	Description
31–16 FRMCNT	Frame Counter. This is a 16-bit Frame Counter (Wraps around automatically after reaching the maximum)
15 FRMCNT_RST	Frame Count Reset. Resets the Frame Counter. (Cleared automatically after reset is done) 0 Do not reset 1 Reset frame counter immediately
14 DMA_REFLASH_RFF	Reflash DMA Controller for Rx FIFO. This bit reflash the embedded DMA controller for Rx FIFO. It should be reflash before the embedded DMA controller starts to work. (Cleared automatically after reflash is done) 0 No reflash 1 Reflash the embedded DMA controller
13 DMA_REFLASH_SFF	Reflash DMA Controller for STAT FIFO. This bit reflash the embedded DMA controller for STAT FIFO. It should be reflash before the embedded DMA controller starts to work. (Cleared automatically after reflash is done) 0 No reflash 1 Reflash the embedded DMA controller

Table continues on the next page...

## CSI\_CSICR3 field descriptions (continued)

Field	Description
12 DMA_REQ_EN_RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent.  000 4 Words 001 8 Words 010 12 Words 011 16 Words 100 24 Words 101 32 Words 110 48 Words 111 64 Words
7 HRESP_ERR_EN	Hresponse Error Enable. This bit enables the hresponse error interrupt.  0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	<b>RxFIFO Full Level.</b> When the number of data in RxFIFO reaches this level, a RxFIFO full interrupt is generated, or an RXFIFO DMA request is sent.  000 4 Words 001 8 Words 010 16 Words 011 24 Words 100 32 Words 101 48 Words 110 64 Words 111 96 Words
3 TWO_8BIT_SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller.  0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode.  0 Zero packing disabled 1 Zero packing enabled

Table continues on the next page...

**CSI\_CSICR3 field descriptions (continued)**

Field	Description
1 ECC_INT_EN	Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode.  0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.
0 ECC_AUTO_EN	Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode.  0 Auto Error correction is disabled. 1 Auto Error correction is enabled.

**16.7.4 CSI Statistic FIFO Register (CSI\_CSISTATFIFO)**

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: 20E\_4000h base + Ch offset = 20E\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STAT																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CSI\_CSISTATFIFO field descriptions**

Field	Description
31–0 STAT	Static data from sensor

## 16.7.5 CSI RX FIFO Register (CSI\_CSIRFIFO)

This read-only register contains received image data. Writing to this register has no effect.

Address: 20E\_4000h base + 10h offset = 20E\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CSI\_CSIRFIFO field descriptions**

Field	Description
31–0 IMAGE	Received image data

## 16.7.6 CSI RX Count Register (CSI\_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: 20E\_4000h base + 14h offset = 20E\_4014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved										RXCNT																					
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	1	1	0	0	0	0	0	0	0	0	0

**CSI\_CSIRXCNT field descriptions**

Field	Description
31–22 -	This field is reserved. Reserved. These bits are reserved and should read 0.
21–0 RXCNT	RxFIFO Count. This 22-bit counter for RXFIFO is updated each time the RXFIFO is read by CPU or DMA. This counter should be set to the expected number of words to receive that would generate an EOF interrupt.

### 16.7.7 CSI Status Register (CSI\_CSISR)

This read/write register shows sensor interface status, and which kind of interrupt is being generated. The corresponding interrupt bits must be set for the status bit to function. Status bits should function normally even if the corresponding interrupt enable bits are not enabled.

Address: 20E\_4000h base + 18h offset = 20E\_4018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved						SF_OR_INT	RF_OR_INT	Reserved	DMA_TSF_DONE_SFF	STATFF_INT	DMA_TSF_DONE_FB2	DMA_TSF_DONE_FB1	RxFF_INT	EOF_INT	SOF_INT
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	F2_INT	F1_INT	COF_INT	Reserved					HRESP_ERR_INT	Reserved					ECC_INT	DRDY
W																
Reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CSI\_CSISR field descriptions**

Field	Description
31–26 -	This field is reserved. Reserved. These bits are reserved and should read 0.
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1)  0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1)  0 RxFIFO has not overflowed. 1 RxFIFO has overflowed.

*Table continues on the next page...*

## CSI\_CSISR field descriptions (continued)

Field	Description
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_ DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the StatFIFO dma controller in CSICR3.(Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO)  0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_ DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_ DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RxFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO)  0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1)  0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)  0 SOF is not detected. 1 SOF is detected.
15 F2_INT	CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match)  <b>NOTE:</b> Only works in CCIR Interlace mode.  0 Field 2 of video is not detected 1 Field 2 of video is about to start
14 F1_INT	CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match)  <b>NOTE:</b> Only works in CCIR Interlace mode.

*Table continues on the next page...*

**CSI\_CSISR field descriptions (continued)**

Field	Description
	0 Field 1 of video is not detected. 1 Field 1 of video is about to start.
13 COF_INT	Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1) 0 Video field has no change. 1 Change of video field is detected.
12–8 -	This field is reserved. Reserved. These bits are reserved and should read 0.
7 HRESP_ERR_INT	Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1) 0 No hresponse error. 1 Hresponse error is detected.
6–2 -	This field is reserved. Reserved. These bits are reserved and should read 0.
1 ECC_INT	CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1) 0 No error detected 1 Error is detected in CCIR coding
0 DRDY	RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO) 0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.

## 16.7.8 CSI DMA Start Address Register - for STATFIFO (CSI\_CSIDMASA\_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 20h offset = 20E\_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DMA_START_ADDR_SFF

R	DMA_START_ADDR_SFF															Reserved
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CSI\_CSIDMASA\_STATFIFO field descriptions

Field	Description
31–2 DMA_START_ADDR_SFF	DMA Start Address for STATFIFO. Indicates the start address to write data. The embedded DMA controller will read data from STATFIFO and write it from this address through AHB bus. The address should be word aligned.
1–0 -	This field is reserved. Reserved. These bits are reserved and should read 0.

## 16.7.9 CSI DMA Transfer Size Register - for STATFIFO (CSI\_CSIDMATS\_STATFIFO)

This register provides the total transfer size for the embedded DMA controller of STATFIFO. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 24h offset = 20E\_4024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CSI\_CSIDMATS\_STATFIFO field descriptions**

Field	Description
31–0 DMA_TSF_ SIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transfered by the embedded DMA controller. The size should be word aligned.

**16.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI\_CSIDMASA\_FB1)**

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 28h offset = 20E\_4028h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	DMA_START_ADDR_FB1															Reserved
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CSI\_CSIDMASA\_FB1 field descriptions**

Field	Description
31–2 DMA_START_ ADDR_FB1	DMA Start Address in Frame Buffer1. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be word aligned.
1–0 -	This field is reserved. Reserved. These bits are reserved and should read 0.

### 16.7.11 CSI DMA Transfer Size Register - for Frame Buffer2 (CSI\_CSIDMASA\_FB2)

This register provides the start address in the frame buffer2 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer2 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 2Ch offset = 20E\_402Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### CSI\_CSIDMASA\_FB2 field descriptions

Field	Description
31–2 DMA_START_ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be word aligned.
1–0 -	This field is reserved. Reserved. These bits are reserved and should read 0.

### 16.7.12 CSI Frame Buffer Parameter Register (CSI\_CSIFBUF\_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 30h offset = 20E\_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CSI\_CSIFBUF\_PARA field descriptions**

Field	Description
31–16 -	This field is reserved. Reserved. These bits are reserved and should read 0.
15–0 FBUF_STRIDE	Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in word) minus the width of the image(in word) is the stride. The stride should be word aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.

**16.7.13 CSI Image Parameter Register (CSI\_CSIMAG\_PARA)**

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transferred in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: 20E\_4000h base + 34h offset = 20E\_4034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CSI\_CSIMAG\_PARA field descriptions**

Field	Description
31–16 IMAGE_WIDTH	Image Width. Indicates how many pixels in a line of the image from the sensor. If the input data from the sensor is 8-bit/pixel format, the IMAGE_WIDTH should be a multiple of 4 pixels. If the input data from the sensor is 10-bit/pixel or 16-bit/pixel format, the IMAGE_WIDTH should be a multiple of 2 pixels.
15–0 IMAGE_HEIGHT	Image Height. Indicates how many pixels in a column of the image from the sensor.

# Chapter 17

## Debug Monitor (DBGMON)

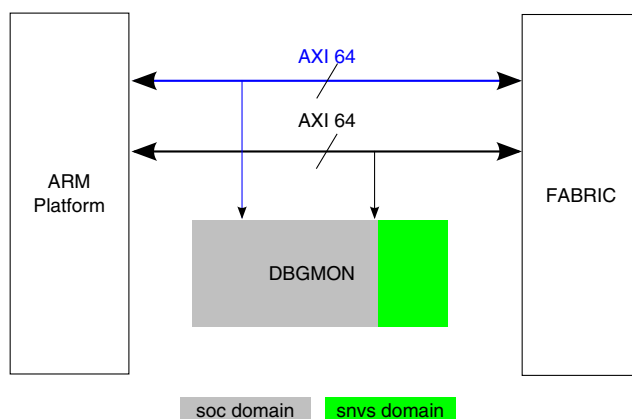

### 17.1 Overview

DBGMON is a real time AXI bus monitor and it is designed to record the last transaction on the AXI bus before the system reset. It monitors the transactions on the bus it is connected to, and records the information of them, such as address, data, ID, etc. In the i.MX 6SoloLite, DBGMON is connected to 2 AXI buses from the ARM platform.

Coordinating with WDOG, DBGMON can save the information of the selected transaction to the registers in SNVS domain, which will not lost the content when the system is powered down.

In addition, DBGMON can also be used for debugging. Various trap conditions can be set to trigger an interrupt.

This section briefly introduces the DBGMON block. The full description of the block is in [Functional Description](#). The figure below shows the DBGMON block diagram.

**Figure 17-1. DBGMON high-level diagram**

## 17.1.1 Features Summary

The key features of the DBGMON include the following:

- Save the selected transaction's information to SNVS domain registers.
- Real-time recording for most recent AXI bus transactions.
- Support out-of-order transaction, support up to 16 IDs.
- Support up to 16 outstanding transactions for each ID.
- Support various interrupts, such as address and ID trap interrupts.

## 17.1.2 Functional Description

DBGMON is designed to record the last transaction on AXI bus before the system reset.

It catch the information of the transaction and store them to SNVS domain registers which will not lost its content during reset or system power off. DBGMON uses WDOG interrupt as the flag indicating the system is going to reset.

In order to store the information when SOC power is off, DBGMON has 2 power domains - SOC power domain and SNVS power domain. In SOC power domain part of DBGMON, a memory with depth 4 will keep recording the transactions on the bus. Once the WDOG interrupt was received, one transaction's info(selected by REQ\_SEL field of HW\_DBGMON\_CTRL) will be snapped to SNVS domain registers.

Since DBGMON needs time to snap the transaction to SNVs domain registers, for WDOG, there should be an time duration between interrupt and ipp\_wdog singals(Any time duration except zero seconds is OK).

Later, when the system go out of the reset, you can read out the content of the information of the transaction from SNVS domain registers. The information includes: Address, Data, ID, RDWR(read/write attribute), COMPLETE(whether this transaction completes).

## 17.1.3 Application

Figure below shows the flowchat of the operation of DBGMON, coordiating with WDOG.

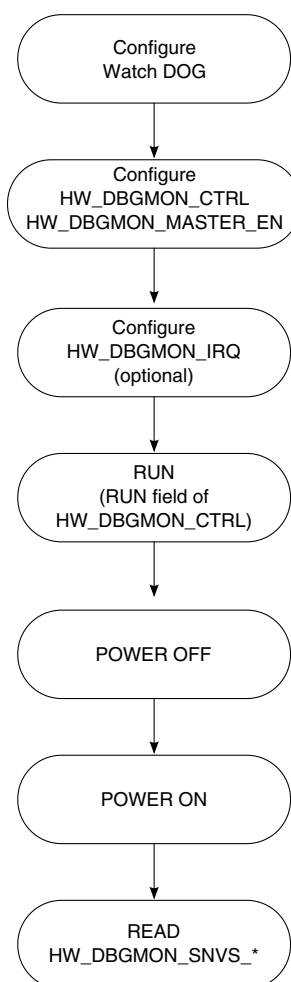

Figure 17-2. Flowchat of the DBGMON operation

## 17.2 DBGMON Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. This table lists the DBGMON registers and their offsets.

### DBGMON memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
412_0000	HW_DBGMON_CTRL (DBGMON_HW_DBGMON_CTRL)	32	R/W	C000_0000h	<a href="#">17.2.1/646</a>

*Table continues on the next page...*

## DBGMON memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
412_0010	HW_DBGMON_MASTER_EN (DBGMON_HW_DBGMON_MASTER_EN)	32	R/W	0000_0000h	<a href="#">17.2.2/648</a>
412_0020	HW_DBGMON_IRQ (DBGMON_HW_DBGMON_IRQ)	32	R/W	0000_FFFFh	<a href="#">17.2.3/649</a>
412_0030	HW_DBGMON_TRAP_ADDR_LOW (DBGMON_HW_DBGMON_TRAP_ADDR_LOW)	32	R/W	0000_0000h	<a href="#">17.2.4/650</a>
412_0040	HW_DBGMON_TRAP_ADDR_HIGH (DBGMON_HW_DBGMON_TRAP_ADDR_HIGH)	32	R/W	0000_0000h	<a href="#">17.2.5/651</a>

## 17.2.1 HW\_DBGMON\_CTRL (DBGMON\_HW\_DBGMON\_CTRL)

Address: 209\_0000h base + 209\_0000h offset = 412\_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	SFTRST	CLKGATE	RSVD4				WDOG_IRQ_SEL		RSVD3			ADDR_MASKEN	RSVD2			WORKMODE
W																
Reset	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1							REQSEL	RSVD0		ID_TRAPMODE	ADDR_TRAPMODE	CLR_SNVS	CLR	SNAP	RUN
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## DBGMON\_HW\_DBGMON\_CTRL field descriptions

Field	Description
31 SFTRST	Set to zero for normal operation. When this bit is set to one(default), then the entire block is held in its reset state

Table continues on the next page...

**DBGMON\_HW\_DBGMON\_CTRL field descriptions (continued)**

Field	Description
	0 Allow DBGMON to operate normally 1 Hold DBGMON in reset
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clock to the block.  0 Allow DBGMON to operate normally 1 Gating off the clock of DBGMON in order to minimize the power consumption.
29–25 RSVD4	Reserved
24 WDOG_IRQ_SEL	Select the source of WDOG IRQ.  0 Select WDOG1 as WDOG IRQ source 1 Select WDOG2 as WDOG IRQ source
23–21 RSVD3	Reserved
20 ADDR_MASKEN	This field control the address mask function,  0 Address mask is disabled, all address range will be monitored 1 Address mask is enabled, address within the range defined by ADDR_HIGH, ADDR_LOW will be monitored
19–17 RSVD2	Reserved
16 WORKMODE	This field defines whether ignore the transaction in IRQ  0 The axi transaction in interrupt status will be monitored 1 The axi transaction in interrupt status will be ignored
15–10 RSVD1	Reserved
9–8 REQSEL	This field defines which sets of AXI transaction will be snapped to SNVS domain registers. Assume (N-3), (N-2), (N-1), N represent four continuous most recent AXI transactions, N is the latest transactions  00 The information of the latest transaction will be snapped to SNVS domain registers 01 (N-1) transaction will be snapped to SNVS domain registers 10 (N-2) transaction will be snapped to SNVS domain registers 11 (N-3) transaction will be snapped to SNVS domain registers
7–6 RSVD0	Reserved
5 ID_TRAPMODE	The bit defines the ID trap function.  0 ID trap function is disabled 1 ID trap function is enabled
4 ADDR_TRAPMODE	The bit defines the address trap function.  0 Address trap function is disabled 1 Address trap function is enabled
3 CLR_SNVS	Set this bit to clear the registers in SNVS domain

*Table continues on the next page...*

**DBGMON\_HW\_DBGMON\_CTRL field descriptions (continued)**

Field	Description
2 CLR	Set this bit to clear the registers in SOC domain. This bit will be automatically set to 0 once the clear process is done
1 SNAP	Set this bit to snapshot the registers selected by REQSEL to SNVS domain registers
0 RUN	Set this bit to one to enable the DBGMON operation  0 HALT, DBGMON is in halt status 1 RUN, DBGMON is in working status

## 17.2.2 HW\_DBGMON\_MASTER\_EN (DBGMON\_HW\_DBGMON\_MASTER\_EN)

Address: 209\_0000h base + 209\_0010h offset = 412\_0010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**DBGMON\_HW\_DBGMON\_MASTER\_EN field descriptions**

Field	Description
31–16 RSVD	Reserved
15 MID15	Set to 1 to enable monitoring on MasterID 15.
14 MID14	Set to 1 to enable monitoring on MasterID 14.
13 MID13	Set to 1 to enable monitoring on MasterID 13.
12 MID12	Set to 1 to enable monitoring on MasterID 12.
11 MID11	Set to 1 to enable monitoring on MasterID 11.

Table continues on the next page...

**DBGMON\_HW\_DBGMON\_MASTER\_EN field descriptions (continued)**

Field	Description
10 MID10	Set to 1 to enable monitoring on MasterID 10.
9 MID9	Set to 1 to enable monitoring on MasterID 9.
8 MID8	Set to 1 to enable monitoring on MasterID 8.
7 MID7	Set to 1 to enable monitoring on MasterID 7.
6 MID6	Set to 1 to enable monitoring on MasterID 6.
5 MID5	Set to 1 to enable monitoring on MasterID 5.
4 MID4	Set to 1 to enable monitoring on MasterID 4.
3 MID3	Set to 1 to enable monitoring on MasterID 3.
2 MID2	Set to 1 to enable monitoring on MasterID 2.
1 MID1	Set to 1 to enable monitoring on MasterID 1.
0 MID0	Set to 1 to enable monitoring on MasterID 0.

**17.2.3 HW\_DBGMON\_IRQ (DBGMON\_HW\_DBGMON\_IRQ)**

Address: 209\_0000h base + 209\_0020h offset = 412\_0020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DBGMON\_HW\_DBGMON\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version
15–0 STEP	Fixed read-only value reflecting the stepping of the RTL version

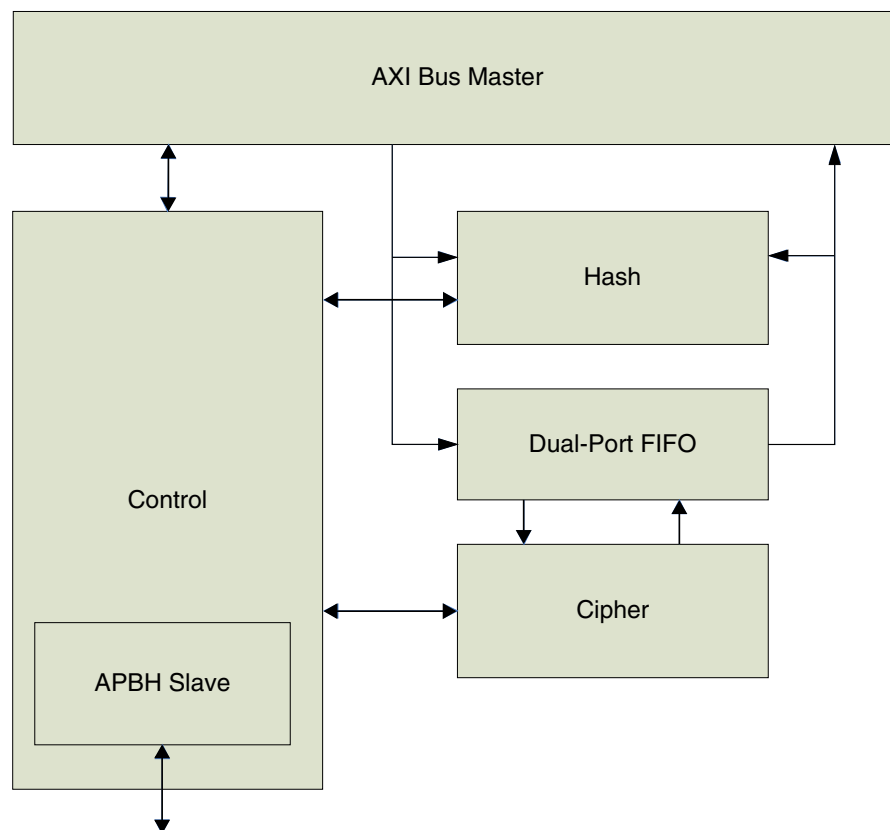

## Chapter 18

# Data Co-Processor (DCP)

### 18.1 Overview

This chapter describes the data co-processor (DCP) block included on the i.MX 6SoloLite and how to use it.

It includes sections on memory copy functionality, Advanced Encryption Standard (AES), hashing, and arbitration. Sections on programming channel operations and example code are also provided. Programmable registers are described in [DCP](#).

**Figure 18-1. Data Co-Processor (DCP) Block Diagram**

The DCP module provides support for general encryption and hashing functions typically used for security functions. Because its basic job is moving data from memory to memory, it also incorporates memory-copy (memcpy) function for both debugging and as a more efficient method of copying data between memory blocks than the DMA-based approach. The memcpy function also has a "blit" mode of operation where it can transfer a rectangular block of data to a video frame buffer.

The DCP has been designed to support a wide variety of encryption and hashing algorithms, and the control structures have been designed to allow flexibility in adding additional algorithms and modes in the future. It supports up to 16 encryption algorithms with up to 16 different modes of operation as well as up to 16 hashing algorithms. While the DCP module has been designed to support numerous algorithms, only a subset may be implemented in any given implementation (see the Capability Register).

The DCP module processes data based on chained command structures written to system memory by software (in a manner similar to the DMA engine). The control block maintains registers to support four independent and concurrent chains, allowing software to virtualize access to the DCP block. Each command in a chain represents a work unit that the module will process to completion. At the end of each work unit, the control logic arbitrates among chains with outstanding commands and processes a command from that chain. Arbitration among the channels is round-robin, allowing all active channels equal access to the data engine. Each channel also supports a "high priority" mode that allows it to have priority over the remaining channels. If multiple channels are selected as high-priority, the channel arbiter selects among the high priority channels in round-robin fashion.

The data flow through the DCP module can be configured in one of five fashions, depending on the functionality activated by the control packet:

- **Memcpy/Blit Mode**-Data is moved unchanged from one memory buffer to another.

- **Encryption Only**-Data from source buffer is encrypted/decrypted into the destination buffer

- **Hashing Only**-Data from source buffer is read, and a hash is generated.

- **Encryption and Input Hashing**-Data from source buffer is encrypted/decrypted into destination, and source buffer is hashed.

- **Encryption and Output Hashing**-Data from source buffer is encrypted/decrypted into destination, and output data is hashed.

### 18.1.1 DCP Limitations for Software

While the DCP module has been designed to be as flexible as possible, there are a few limitations to which software must adhere:

- Buffer sizes for all operations **MUST** be aligned to the natural size of the transfer algorithm used. Memcopy operations can transfer any number of bytes (one-byte granularity) and AES operations must be multiples of 16 bytes (four-word granularity). For all operations, if the byte count is not a word granularity, the hardware rounds up to the next word. Hashing is supported at a byte granularity.
- The DCP module supports buffer operations to any byte alignment, but performance will be improved if buffers are aligned to a four-byte boundary, since fetch/store operations can be performed without having to do byte operations to accommodate the misaligned addresses.
- Hash operations are limited to a 512 Mbyte buffer size. The hardware only implements a 32-bit hash length counter instead of the 64-bit counter supported by

the SHA-1/SHA-256 algorithm (counter counts bits, not bytes, therefore a total of 512 Mbytes).

- For chained hashing operations (operations involving multiple descriptors), every descriptor except the last must have a byte count that is a 16-word multiple (granularity of the hash algorithm).
- Key values cannot be written while the AES block is active. This limitation exists because the key RAM is in use while AES is operational. Any writes from the peripheral bus cannot be held in wait states; therefore, the RAM must be accessible during key writes.
- The byte-swap controls can only be used with modulo-4 length buffers. For non-modulo-4 lengths, the final partial word will contain incorrect data. Any address alignment can be used with byte swapping, however.
- The word-swap controls are only useful with cipher operations, because the logic forms the 128-bit cipher data from four words from system memory. The word-swap controls are ignored for memcpy or hashing operations.
- DCP only supports writes to word boundaries to OCRAM.

## 18.2 Clocks

The following table describes the clock sources for DCP. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 18-1. DCP Clocks**

Clock name	Clock Root	Description
dcp_clk	ahb_clk_root	DCP clock
mem_clk	ahb_clk_root	DCP memory clock

## 18.3 Operation

The top-level DCP module contains the AXI master, peripheral slave bus interface units, the main control block and FIFO, and any encryption or hashing blocks included with the design.

The controller manages the fetching of work blocks, the fetching/storing of context information when switching between chain pointers, and the managing of the data flow through the FIFO, SHA, and AES blocks. Data entering the block from the AXI master is placed in the FIFO for consumption by the cipher block. After the cipher module has finished its operation, data is placed back into the FIFO and stored back to memory via

the AXI master. When hashing is enabled, the SHA block takes its inputs from the bus side of the FIFO to allow it to operate without waiting for the cipher block to complete. The peripheral slave provides all register controls and interfaces mainly with the control block.

### 18.3.1 Memory Copy, Blit, and Fill Functionality

In its most basic operation, the DCP supports moving unmodified data from one place in system memory to another.

This functionality is referred to as "memcpy", because it operates only on memory and it copies data from one place to another. Typical uses for memcpy might be for fast virtual memory page moves or repositioning data blocks in memory. Memcopy buffers can be aligned to any memory address and can be of any length (byte granularity). For best performance, buffers should be word-aligned, although the DCP includes enhancements to improve performance for unaligned cases.

The DCP also has the ability to do basic "blit" operations that are typical in graphics operations. To specify a blit, the control packet must have the ENABLE\_BLIT bit set in the packet control register. Blit source buffers must be contiguous. The output destination buffer for a blit operation is defined as a "M runs of N bytes" that define a rectangular region in a frame buffer. For blit operations, each line of the blit may consist of any number of bytes. After performing a "run", the DCP updates the destination pointer such that the next destination address falls on the pixel below the start of the previous run operation. This is done by incrementing the starting pointer by the frame buffer width, which is specified in the Control field.

In addition to being able to copy data within memory, the DCP also provides a "fill" operation, where source data comes not from another memory location, but from an internal register (the source buffer address in the control packet). This is done whenever the DCP\_Control0[CONSTANT\_FILL] flag is set in the packet control register (see [Control1 Field](#)). This feature may be used with memcpy to prefill memory with a specified value or during a blit operation to fill a rectangular region with a constant color.

### 18.3.2 Advanced Encryption Standard (AES)

The AES block implements a 128-bit key/data encryption/decryption block as defined by the National Institute of Standards and Technology (NIST) as US FIPS PUB 197, dated November 2001 (see references for specifications and toolkits).

### 18.3.2.1 Key Storage

The DCP implements four SRAM-based keys that may be used by software to securely store keys on a semi-permanent basis. The keys may be written via the programming interface by specifying a key index to specify which key to load and a subword pointer that indicates which word to write within the key. After a subword is written, the logic automatically increments the subword pointer so that software can program the higher-order words of the key without rewriting the key index. Keys written into the key storage are not readable.

To use a key in the key storage, the cipher descriptor packet should select the key by setting the DCP\_Control1[KEY\_SELECT] field in the Control1 descriptor field without setting the OTP\_KEY or PAYLOAD\_KEY fields in the Control0 register. See [Control0 Field](#) and [Control1 Field](#).

### 18.3.2.2 AES OTP Key

After a system reset, the OTP controller reads the e-fuse devices and provides OTP key information to the DCP. The DCP receives a 64-bit UNIQUE KEY and a 128-bit CRYPTO KEY. Depending on a key path control fuse the DCP receives the CRYPTO KEY either directly or indirectly through the SNVS trust controller module. The CRYPTO KEY in fuses is actually 256 bits and a mux is used to select the high or low 128 bits of the key. The DCP internally generates the control logic signals to capture this key into the key RAM. The system reset controller coordinates the deassertion of reset such that the OTP key is stable before the DCP reads it. If the SNVS key path is chosen then a security violation removes the CRYPTO KEY, resets the key in the DCP, and makes the key unavailable to the DCP until the next successful secure boot.

To use the OTP key, the descriptor packet should set the OTP\_KEY field in the Control1 register (see [Control1 Field](#)).

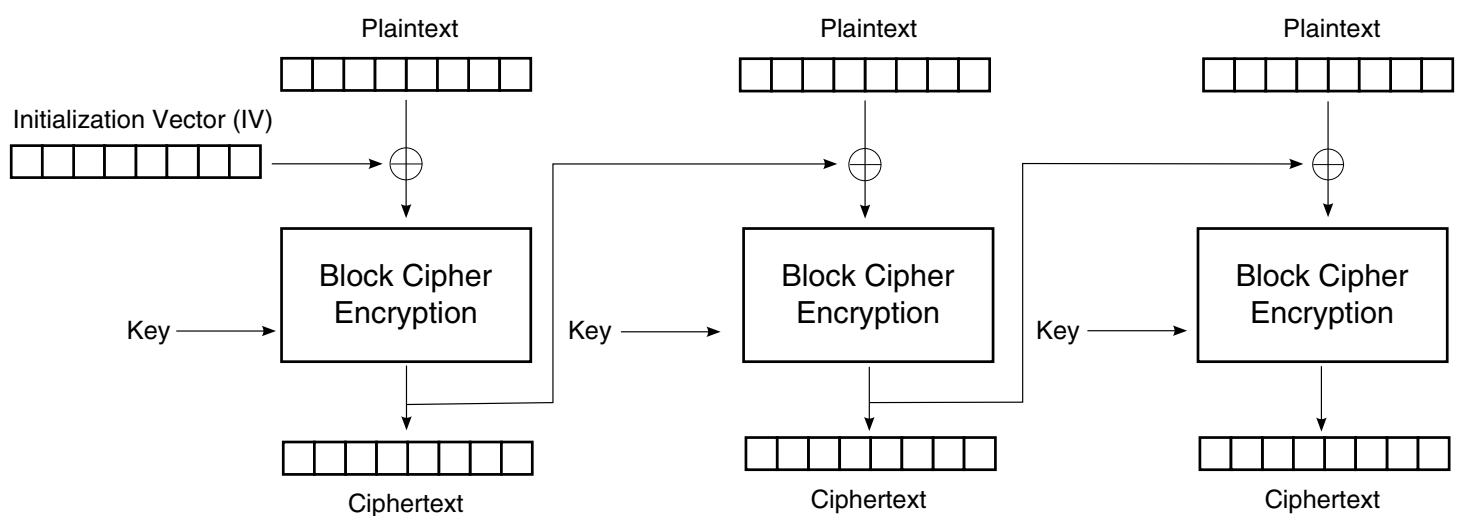

### 18.3.2.3 Encryption Modes

The most basic form of encryption is the Electronic Code Book (ECB) mode. In this mode, the encryption output is a function only of the key and the plaintext, thus it can be visualized as a giant lookup table. While this provides a great deal of security, there are a few limitations. For instance, if the same plaintext appears more than once in a block of data, the same ciphertext will also appear. This can be very evident if the plaintext contains large blocks of constant data (0s for example) and can be used to formulate attacks against a key.

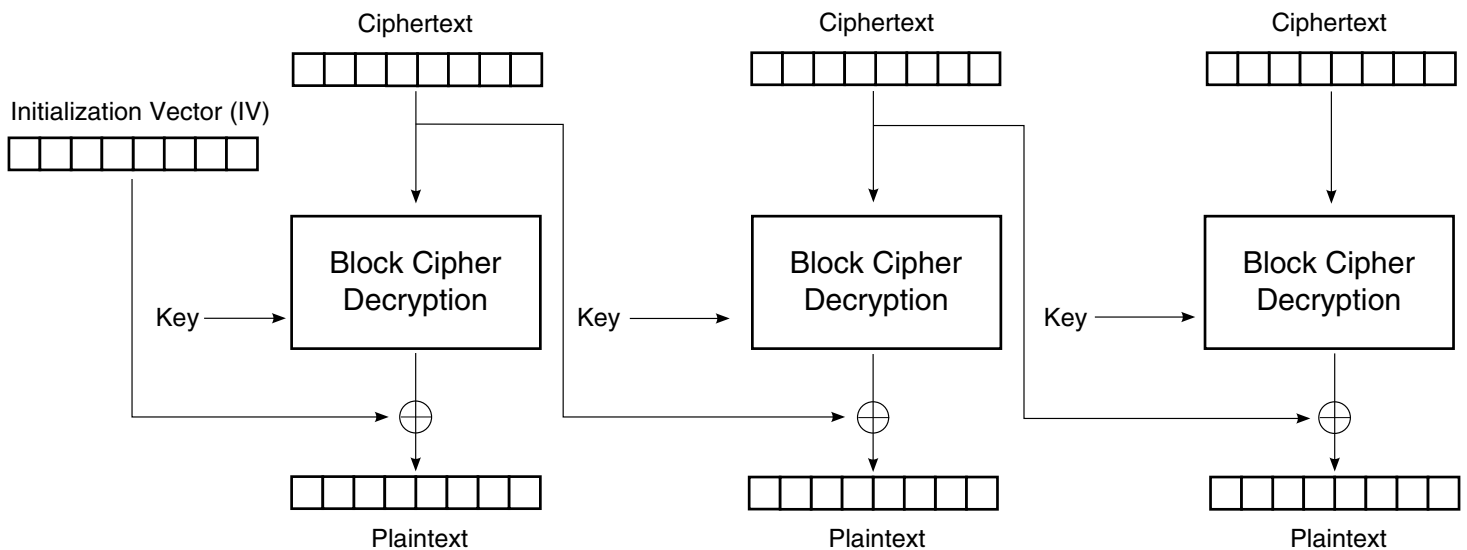

In order to make ciphers stronger, several modes of operation can be implemented around the basic ECB cipher to provide additional security. One such mode is CBC mode (Cipher Block Chaining), which takes the previous encrypted data and logically XORs it with the next incoming plaintext before performing the encryption. During decryption, the process is reversed and the previous encrypted data is XORed with the decrypted ECB data to provide the plaintext again.

The AES engine supports handling the various modes of operation. The core AES block supports ECB mode, and other algorithms are handled in the wrapper around the encryption blocks. The DCP module supports Cipher Block Chaining (CBC), which chains the data blocks by XORing the previously encrypted data with the plaintext before encryption. Cipher block chaining encryption is illustrated in [Figure 18-2](#).

**Figure 18-2. Cipher Block Chaining (CBC) Mode Encryption**

Decryption (shown in [Figure 18-3](#)) works in a similar manner, where the cipher text is first decrypted and then XORed with the previous ciphertext. For the first encryption/decryption operation, an initialization vector (IV) is used to seed the operation. The IV must be the same for both the encryption and decryption steps; otherwise, decrypted data will not match the original plaintext.

**Figure 18-3. Cipher Block Chaining (CBC) Mode Decryption**

### 18.3.3 Hashing

The hashing module implements the SHA-1 and SHA-256 hashing algorithms and a modified CRC-32 checksum algorithm.

These algorithms produce a signature for a block of data that can be used to determine whether the data is intact.

The CRC-32 algorithm implements a 32-bit CRC algorithm similar to the one used by Ethernet and many other protocols. The CRC differs from the Unix `cksum()` function in three ways:

- The CRC is initialized as 0xFFFFFFFF instead of 0x00000000.
- Logic pads zeros to a 32-bit boundary for trailing bytes.
- Logic does not post-pend the file length.

The SHA-1 block implements a 160-bit hashing algorithm that operates on 512-bit (64-byte) blocks as defined by US FIPS PUB 180-1 in 1995. The SHA-256 mode implements a 256-bit hashing algorithm that operates on 512-bit (64-byte) blocks as defined by US FIPS PUB 180-2 in 2002. The purpose of the hashing module is to generate a unique signature for a block of data that can be used to validate the integrity of the data by comparing the resulting "digest" with the original digest.

Results from hash operations are written to the beginning of the payload for the descriptor. The DCP also has the ability to check the resulting hash against a value in the payload and issue an interrupt if a mismatch occurs.

### 18.3.4 One Time Programmable (OTP) Key

After a system reset, the One Time Programmable (OTP) controller will read the e-fuse devices and provide OTP key information to the DCP through the 128-bit wide `otp_crypto_key_data` input data bus and the 64 bit wide `otp_unique_key_data` unique key input that come directly from the OTP controller.

These bus input values are held constant and originate from the eFuse shadow registers after reset. (Note that the shadow registers for these bits can be changed in the OTP block if they are unlocked.) They will only be loaded by the DCP once after the deassertion of system reset. After reset, the DCP automatically loads these wide keys 32 bits at the time into the internal key RAM.

In i.MX 6SoloLite, DCP can also get a 128-bit OCOTP key through SNVS as another option of 128-bit wide key directly from OTP controller. Setting of fuse bit "OTP\_KEY\_TO\_DCP\_DISABLE" will select the SNVS key mode, in this mode DCP will load the SNVS key with each software reset.

While OTP key is normally not available to read operations, the module will allow the key to be read if the `otp_crypto_key_ren` (read-enable) input is active (high). This allows verification of the key after it has been programmed into the eFuse device. After programming has been validated, another fuse will be set to disable the read capability.

The OTP key (crypto key) may be selected using the `DCP_Control1[OTP_KEY]` bit in the control field of the packet descriptor or by using key select `0xFF` in the `CTRL1` field of the descriptor. DCP also supports a second hardware key called the `UNIQUE_KEY` which is generated from the OTP KEY and key modifier bits from other OTP fuse fields. This key is unique to the device and may be used for encrypting private data stored on the NAND. This key may be selected by writing `0xFE` to the `KEY_SELECT` field in the `CTRL1` packet data.

### 18.3.5 Managing DCP Channel Arbitration and Performance

The DCP can have four channels all competition for DCP resources to complete their operations.

Depending on the situation, critical operations may need to be prioritized above less important operations to ensure smooth system operation. To help software achieve this goal, the DCP implements a programmable arbiter for internal DCP operations and provides "recovery" timers on each channel to throttle channel activity.

### 18.3.5.1 DCP Arbitration

The DCP implements a multi-tiered arbitration policy that allows software a lot of flexibility in scheduling DCP operations. [Figure 18-4](#) illustrates the arbitration levels and where each channel fit into the arbitration scheme.

		Channels			
		0	1	2	3
Priority Level	High	1	1	1	1
	Low	0	0	0	0

**Figure 18-4. DCP Arbitration**

Each channel can be programmed as being in either the high-priority or low-priority arbitration pool, depending on the setting in the `HIGH_PRIORITY_CHANNEL` field of the `DCP_CHANNELCTRL` register. When the corresponding bit is programmed as a 1, the channel arbitrates in the high-priority pool; otherwise it arbitrates in the low-priority pool. Once a channel has been selected, it completes one packet and then the arbiter re-arbitrates. The channel that just completed participates in the new arbitration round.

### 18.3.5.2 Channel Recovery Timers

Each channel also contains a channel recovery timer in its `DCP_CHnOPTS` register. The purpose of the recovery timer is to keep the channel inactive for a period of time after it completes an operation. This capability could be used for a high-priority channel to ensure that at least some lower-priority requests get serviced between packets or to simply allow more timeslices for other channels to perform operations. The value programmed into the recovery timers register delays the channel from operations until 16 times the programmed value. Any non-zero value should prevent the channel from participating in the next arbitration cycle.

### 18.3.6 Programming Channel Operations

The control logic block maintains the channel pointers and manages arbitration and context switching between the different channels.

It also manages the fetching of work packets and data fetch/store operations from the AXI master interface and coordinates the actions of the hashing and encryption blocks.

The control logic maintains four channels that allow software to effectively create four independent work sets for the DCP module. Software can construct chained control packets in memory that describe encryption/hashing/memcopy operations to the hardware unit. The address for this first control packet can be written to one of the four virtual channels and enabled. When one or more of the channels is enabled, the controller fetches the control packet pointed to by that channel and initiate data fetches from the source buffer. Data is then processed as described in the control packet and stored back to system memory.

Once the processing for a control packet is complete, the controller writes completion status information back to the control packet, and optionally stores relevant state information to the context buffer. If the control packet specifies a subsequent control packet, the channel's pointer is updated to the address for the next packet and an optional interrupt can be issued to the processor.

At this point, the DCP module arbitrates among the virtual channels for the next operation and processes its control packet. If a subsequent operation is continued from a previous operation, the controller automatically loads the context from the previous session into the working registers before resuming operation for that channel.

#### 18.3.6.1 Virtual Channels

The DCP module processes data via work packets stored in memory. Each of the channels contains a pointer to the current work packet and enough control logic to determine whether the channel is active and to provide status to the processor. Each channel also provides a recovery timer to help throttle processing by a particular channel. After processing a packet, the channel enables its 16-bit recovery timer (if the recovery time is set to a non-zero value). The channel will not become active again until its recovery timer has expired. The recovery timer timebase is 16 HCLK cycles, so the timer acts as a 20-bit timer with the bottom four bits implicitly tied to 0. This provides an effective range of zero to  $2^{20-1}$  clocks or 0 ns to 7.8 ms at 133 MHz.

A channel is activated any time its semaphore is non-zero and its recovery timer is cleared. The semaphore can be incremented by software to indicate that the chain pointer has been loaded with a valid pointer. As the hardware completes the work packets, it decrements the semaphore if the Decrement Semaphore flag in the Control 0 field set. Work packets may be chained together using the CHAIN or CHAIN\_CONTIGUOUS bits in the Control0 field, which causes the channel to automatically update the work packet pointer to the value in the NEXT\_COMMAND\_ADDRESS field at the end of the current work packet.

### 18.3.6.2 Context Switching

The control logic maintains four virtual channels that allow the DCP block to time-multiplex encryption, hashing, and memcpy operations, it must also retain state information when changing channels so that when a channel is resumed, it can resume the operation from where it left off. This process is called context-switching.

To minimize the number of registers used in the design, the controller saves context information from each channel into a private context area in system memory. When initializing the DCP module, software must allocate memory for the context buffer and write the address into the Context Buffer Pointer register. As the DCP module processes packets, it saves the context information for each channel to the buffer after completing each control packet. When the channel is subsequently activated, the DCP module's internal registers are then reloaded with the proper context before resuming the operation.

Each channel reserves one-fourth of the context buffer area for its context storage. The context buffer consumes 208 bytes of system memory and is formatted as shown in [Table 18-2](#).

**Table 18-2. DCP Context Buffer Layout**

Range	Channel	Data	Size
0x00-0x0C	3	Cipher Context	16 bytes
0x10-0x30	-	Hash Context	36 bytes
0x34-0x40	2	Cipher Context	16 bytes
0x44-0x64	-	Hash Context	36 bytes
0x68-0x74	1	Cipher Context	16 bytes
0x78-0x98	-	Hash Context	36 bytes
0x9C-0xA8	0	Cipher Context	16 bytes
0xAC-0xCC	-	Hash Context	36 bytes

The control logic writes to the context buffer only if the function is being used. This effectively means that the cipher context is stored for CBC encryption/decryption operations only, and the hash context is written only if SHA-1/SHA-256 is utilized. If neither of these modes are used for a given channel, the memory for the context buffer need not be allocated by software.

Since channel 0 is likely to be used for VMI in an SDRAM-based system-to-page data from the SDRAM to on-chip SRAM, the buffer allocation table has been organized so that the *highest* numbered channel uses the *lowest* area in the context buffer. For this reason, software should allocate the higher numbered channels for encryption/hashing operations and the lower numbered channels for memcpy operations to reduce the size of the context buffer.

If only a single channel is used for CBC mode operations or hashing operations, the controller provides a bit in the control register to disable context switching. In this scenario, context switching is not required, because other channels will not corrupt the state of the hashing or cipher modes. Thus, when the channel resumes, a context load is not required.

Additionally, the control logic monitors the use of CBC/hashing, so that a context reload is not done if the previous channel resumes an operation without an intermediate operation from another channel.

### 18.3.6.3 Working with Semaphores

Each channel has a semaphore register to indicate that control packets are ready to be processed. Several techniques can be used when programming the semaphores to control the execution of packets within a channel. The channel will continue to execute packets as long as the semaphore is non-zero, a chain bit is set in the descriptor, and no error has occurred.

- Software can write the number of pending packets into the semaphore register with the Decrement Semaphore bit in each control packet set. In this scenario, the channel simply decrements the semaphore for each packet set and terminates at the end of the packet chain. The benefit of this method is that software can easily determine how many packets have executed by reading the semaphore status register.
- Software can create a packet chain with the Decrement Semaphore bit set only in the last packet. In this case, software would write a 1 to the semaphore register to start the chains and the DCP will terminate after executing the last packet.
- Software can create a packet chain with the Decrement Semaphore bit set for each packet and write either a 1 or a number less than the number of packets to the semaphore register. This can be useful when debugging, because it allows the

channel to execute only a portion of the packets and software can inspect intermediate values before restarting the channel again.

If an error occurs, the channel issues an interrupt and clears the semaphore register. The channel does not perform any further operations until the error bits in the status register have been cleared. Software can manually clear a non-zero semaphore by writing 0xFF to the CLR (clear) address of the semaphore register.

#### 18.3.6.4 Work Packet Structure

Work packets for the DCP module are created in memory by the processor. Each work packet includes all information required for the hardware to process the data. The general structure of the packet is shown in [Figure 18-5](#).

Word0	Next Cmd Addr
Word1	Control0
Word2	Control1
Word3	Source Buffer Addr
Word4	Destination Buffer Addr
Word5	Buffer Size
Word6	Payload Pointer
Word7	Status

**Figure 18-5. DCP Work Packet Structure**

For some operations, additional information is required to process the data in the packet. This additional information is provided in the variable-sized payload buffer, which can be found at the address specified in the payload pointer field. When encryption is specified, the payload may include the encryption key (if the key selected resides in the packet), an initialization vector (for modes of operation such as CBC), and expected hash values when data hashing is indicated. The hardware can automatically compare the expected hash with the actual hash and interrupt the processor only on a mismatch. The payload area is used by software to store the calculated hash value at the end of hashing operations (when the HASH\_TERM control bit in DCP\_Control0 is set).

18.3.6.4.1 Next Command Address Field

The NEXT\_COMMAND\_ADDRESS field (as shown in [Table 18-3](#)) is used to point to the next work packet in the chain. This field is loaded into the channel's command pointer after the current packet has completed processing if the CHAIN bit in the CONTROL0 field (see [Table 18-4](#)) is set. The Next Command Address field should be programmed to a non-zero value when the CHAIN bit is set; otherwise, the channel will flag an invalid setup error.

Table 18-3. DCP Next Command Address Field

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
NEXT_COMMAND_ADDRESS																															

18.3.6.4.2 Control0 Field

>The main functions of the DCP module are enabled with the ENABLE\_MEMCOPY, ENABLE\_BLIT, ENABLE\_CIPHER, and ENABLE\_HASH bits from the Control0 field in the work packet.

The combinations of these bits determine the function performed by the DCP. [Table 18-5](#) summarizes the function performed for each combination.

Table 18-4. DCP Control0 Field

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

Table continues on the next page...

	ENABLE_BLIT
	ENABLE_HASH
	ENABLE_CIPHE
	ENABLE_MEMCOPY
	CHAIN_CONTINUOUS
	CHAIN
	DECR_SEMAPHOR
	INTERRUPT_ENABL

**Table 18-5. DCP Function Enable Bits**

Hash	Cipher	Blit	Memcopy	Description
0	0	0	X	Simple memcopy operation.
0	0	1	0	Blit operation.
0	1	0	0	Simple encrypt/decrypt operation.
1	0	0	0	Simple hash. Only reads performed.
1	0	0	1	Memcopy and hash operation.
1	1	0	0	Hash with encryption/decryption.
All Others				Invalid setup.

The CHAIN bit should be set if the NEXT\_COMMAND\_ADDRESS field has a valid pointer to the next work packet. When set, this bit causes the channel to update its pointer to the next packet. The CHAIN\_CONTINUOUS bit is similar, but it indicates that the next packet follows immediately after the current packet. This allows software to generate templates of operations without regard to the actual physical addresses used, which makes programming easier, especially in a virtual memory environment.

If the INTERRUPT\_ENABLE bit is set, the channel generates an interrupt to the processor after completing the work for this packet. When the interrupt is issued, the packet will have been completely processed, including the update of the status/payload fields in the work packet.

Each channel contains an eight-bit counting semaphore that controls whether it is in the run or idle state. When the semaphore is non-zero, the channel is ready to run and process commands. Whenever a command finishes its operation, it checks the DECR\_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by software. When the semaphore goes to non-zero and the channel is in its idle state, it then uses the value in the NEXT\_COMMAND\_ADDRESS field to begin processing.

If the `ENABLE_CIPHER` bit is set, the data is encrypted or decrypted based on the `CIPHER_ENCRYPT` bit using the key/encryption settings from the `Control1` field. The `OTP_KEY` and `PAYLOAD_KEY` indicate the source of the keys for the operation. If the `OTP_KEY` value is set, the `KEY_SELECT` field from the `Control1` register indicates which OTP key is to be used. If the `PAYLOAD_KEY` bit is set, the first entry in the payload is the key to be used for the operation. If neither bit is set, the `KEY_SELECT` field indicates an index in the key RAM that contains the key to be used. (For cases when both the `OTP_KEY` and `PAYLOAD_KEY` bits are set, the `PAYLOAD_KEY` takes precedence.)

The `HASH_ENABLE` enables hashing of the data with the `HASH_OUTPUT` bit controlling whether the input data (`HASH_OUTPUT=0`) or output data (`HASH_OUTPUT=1`) is hashed. In addition, the hardware can be programmed to automatically check the hashed data if the `HASH_CHECK` bit is set. If the hash does not match, an interrupt is generated and the channel terminates operation on the current chain. The hashing algorithms also require two additional fields in order to operate properly. The `HASH_INIT` bit should be set for the first block in a hashing pass to properly initialize the hashing function. The `HASH_TERM` bit must be set on the final block of a hash to notify the hardware that the hashing operation is complete so that it can properly pad the tail of the buffer according to the hashing algorithm. This flag also triggers the write-back of the hash output to the work packet's payload area.

The `CONSTANT_FILL` flag may be used for both memcpy and blit operations. When this is set, the source address field is used instead as a constant that is written to all locations in the output buffer.

The `WORDSWAP` and `BYTESWAP` bits enable muxes around the FIFO to swap data to handle little-endian and big-endian storage of data in system memory. When these bits are cleared, data is assumed to be in little-endian format. When all bits are set, data is assumed to be in big-endian format.

The `TAG` field is used to identify the work packet and the associated completion status. As each packet is completed, the channel provides the status and tag information for the last packet processed.

#### 18.3.6.4.3 Control1 Field

The `Control1` field (shown in [Table 18-6](#)) provides additional values used when hashing or encrypting/decrypting data.

For blit operations, this field indicates the number of bytes in a frame buffer line, which is used to calculate the address for successive lines in each blit operation.

**Table 18-6. DCP Control1 Field**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
CIPHER_CONFIG												HASH_SELECT				KEY_SELECT								CIPHER_MODE				CIPHER_SELECT			
																FRAMEBUFFER_LENGTH (in bytes, blit mode)															

The CIPHER\_SELECT field selects from one of sixteen possible encryption algorithms (0=AES128). The CIPHER\_MODE selects the mode of operation for that cipher (0=ECB, 1=CBC).

The KEY\_SELECT field allows key selection for one of several sources. Keys can be included in the packet payload or may come from OTP or write-only registers.

The HASH\_SELECT field selects a hashing algorithm for the operation (0=SHA-1, 1=CRC32, 2=SHA-256).

The CIPHER\_CONFIG field provides optional configuration information for the selected cipher. An example would be a key length for the RC4 algorithm.

#### 18.3.6.4.4 Source Buffer

The SOURCE\_BUFFER pointer (shown in [Table 18-7](#)) specifies the location of the source buffer in memory. The buffer may reside at any byte alignment and should refer to an on-chip SRAM or off-chip SDRAM location. For optimal performance, buffers should be word aligned. When the CONSTANT\_FILL flag is set in the Control0 field, the value in this field is used as the data written to all destination buffer locations.

**Table 18-7. DCP Source Buffer Field**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
SOURCE_BUFFER																															
CONSTANT (CONSTANT_FILL mode)																															

#### 18.3.6.4.5 Destination Buffer

The DESTINATION\_BUFFER (shown in [Table 18-8](#)) specifies the location of the destination buffer in on-chip SRAM or off-chip SDRAM memory and may be set to any byte alignment. For in-place encryption, the destination buffer and source buffer should be the same value. For optimal performance, the buffer location should be word-aligned.

**Table 18-8. DCP Destination Buffer Field**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
DESTINATION_BUFFER																															

#### 18.3.6.4.6 Buffer Size Field

The BUFFER\_SIZE field (shown in [Table 18-9](#)) indicates the size of the buffers for memcpy, encryption, and hashing modes. For memcpy and hashing operations, the value may be any number of bytes (byte granularity), and for encryption modes, the length must be a multiple of the selected encryption algorithm's natural data size (16 bytes for AES).

**Table 18-9. DCP Buffer Size Field**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
NUMBER_LINES (blit mode)																BLIT_WIDTH (in bytes, blit mode)															
BUFFER_SIZE (in bytes, memcpy, encryption, hashing modes)																															

For blit operations, the buffer size field is split into two portions, a BLIT\_WIDTH value, which specifies the number of bytes in each "line" of the blit operation, and a NUMBER\_LINES value, which specifies how many vertical rows of pixels are in the image buffer.

#### 18.3.6.4.7 Payload Pointer

Some operations require additional control values that are stored in a Payload Buffer (shown in [Table 18-10](#)), which is pointed to by this field. After the DCP reads the control packet, it examines the Control0 register and determines whether any payload information is required. If so, the DCP loads the payload from the address specified in this field. (See [Payload](#) for more details.)

**Table 18-10. DCP Payload Buffer Pointer**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
PAYLOAD_POINTER																															

The payload area is also written to by the DCP at the completion of a hash operation (when the HASH\_TERM) bit is set. Software must allocate the appropriate amount of storage (20 bytes for SHA-1 and 4 bytes for CRC32) in the payload or risk having the DCP write to an unallocated address.

18.3.6.4.8 Status

After the DCP engine has completed processing of a descriptor, it writes the packet status (shown in [Table 18-11](#)) back to the descriptor In the Status field. The packet status is the value of the channel status register at the time the packet completed processing.

Table 18-11. DCP Status Field

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----

Table continues on the next page...

**Table 18-11. DCP Status Field (continued)**

TAG
ERROR_CODE
E
ERROR_DS
ERROR_SR
ERROR_PACKET
ERROR_SETU
HASH_MISMATCH
COMPLETE

For various error conditions, the DCP encodes additional error information in the `ERROR_CODE` field. See [DCP](#) for more details on assignments of error codes. For any completion codes besides the `COMPLETE` flag, the channel suspends processing of the command chain until the error status values are cleared in the channel status register.

The format for this field is the same as for the channel status register, with the exception that the COMPLETE bit is written to the payload status but is not present in the channel status register.

#### 18.3.6.4.9 Payload

>The payload is a variable-length field that is used to provide key, initialization values, and expected results from hashing operations.

The payload may consist of the data fields listed in [Table 18-12](#).

### Table 18-12. DCP Payload Field

Field Name	Size	Description	Condition
Cipher Key	16 bytes	AES key	Cipher enable with PAYLOAD_KEY
Cipher IV	16 bytes	CBC initialization vector	Cipher enable with CBC mode.
Hash Check	20 bytes	Hash completion value	Hash enabled with HASH_TERM fields set.

If fields are not used, they do not appear in the payload and the other payload values move upwards in the payload area. For instance, if only hashing is used, then the HASH\_CHECK value would appear at offset 0 in the payload area. [Table 18-13](#) should be used by software to determine the amount of payload to allocate and initialize.

**Table 18-13. DCP Payload Allocation by Software**

Control Bits Present			Payload Size
Hash_Check	Cipher_Init	Payload_Key	
0	0	0	0 words / 0 bytes
0	0	1	4 words / 16 bytes

Table continues on the next page...

**Table 18-13. DCP Payload Allocation by Software (continued)**

Control Bits Present			Payload Size
Hash_Check	Cipher_Init	Payload_Key	
0	1	0	4 words / 16 bytes
0	1	1	8 words / 32 bytes
1	0	0	SHA-1: 5 words / 20 bytes SHA-2: 8 words / 32 bytes
1	0	1	SHA-1: 9 words / 36 bytes SHA-2: 12 words / 48 bytes
1	1	0	SHA-1: 9 words / 36 bytes SHA-2: 12 words / 48 bytes
1	1	1	SHA-1: 13 words / 52 bytes SHA-2: 16 words / 64 bytes

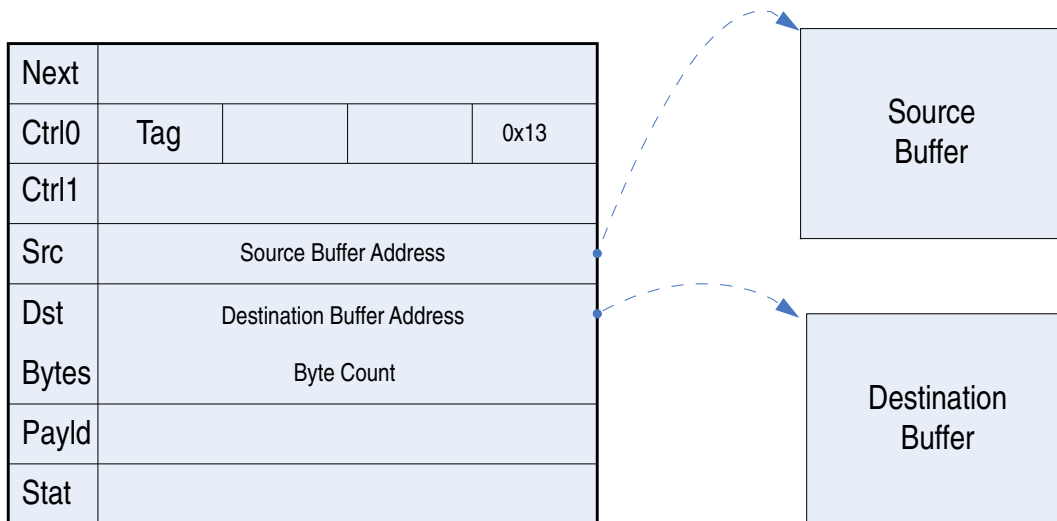

For hashing operations, the DCP module writes the final hash value back to the start of the payload area for descriptors with the HASH\_TERM bit set in the control packet. It is important that software allocate the required payload space, even though it is not required to set up the payload for control purposes.

## 18.3.7 Programming DCP Functions

### 18.3.7.1 Basic Memory Copy Programming Example

To perform a basic memcpy operation, only a single descriptor is required. The DCP simply copies data from the source to the destination buffer. This process is illustrated in [Figure 18-6](#).

0x13 = Memcopy | DecrSema | Interrupt

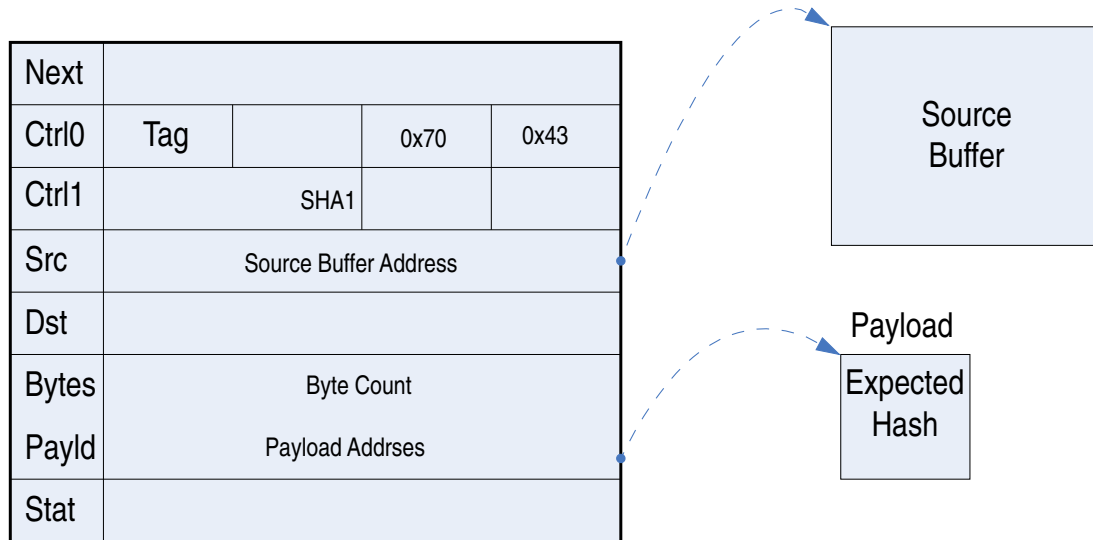

**Figure 18-6. Basic Memory Copy Operation**

```
<code>
typedef struct _dcp_descriptor
{
    u32          *next;
    hw_dcp_packet1_t  ctrl0;
    hw_dcp_packet2_t  ctrl1;
    u32          *src,
                *dst,
                buf_size,
                *payload,
                stat;
} DCP_DESCRIPTOR;

DCP_DESCRIPTOR dcp1;
u32 *srcbuffer, *dstbuffer;
// set up control packet
dcp1.next = 0; // single packet in chain
dcp1.ctrl0.U = 0; // clear ctrl0 field
dcp1.ctrl0.B.ENABLE_MEMCOPY = 1; // enable memcopy
dcp1.ctrl0.B.DECR_SEMAPHORE = 1; // decrement semaphore
dcp1.ctrl0.B.INTERRUPT = 1; // interrupt
dcp1.ctrl1.U = 0; // clear ctrl1
dcp1.src = srcbuffer; // source buffer
dcp1.dst = dstbuffer; // destination buffer
dcp1.buf_size = 512; // 512 bytes
dcp1.payload = NULL; // not required
dcp1.status = 0; // clear status
// Enable channel 0
HW_DCP_CHnCMDPTR_WR(0, dcp1); // write packet address to pointer register
HW_DCP_CHnSEMA_WR(0, 1); // increment semaphore by 1
// now wait for interrupt or poll
// polling code
while ( (HW_DCP_STAT_RD() & 0x01) == 0x00 );
// now check/clear channel status
if ( (HW_DCP_CHnSTAT_RD(0) & 0xFF) != 0 ) {
    // an error occurred
    HW_DCP_CHnSTAT_CLR(0, 0xff);
}
// clear interrupt register
HW_DCP_STAT_CLR(1);
</code>
```

### 18.3.7.2 Basic Hash Operation Programming Example

To perform a basic hash operation, only a single descriptor is required. The DCP simply reads data from the source buffer and computes the hash value on the contents. This process is illustrated in Figure 18-7.

0x70 = Hash Check | Hash Term | Hash Init

0x43 = Hash Enable | DecrSema | Interrupt

**Figure 18-7. Basic Hash Operation**

```
<code>
typedef struct _dcp_descriptor
{
    u32          *next;
    hw_dcp_packet1_t  ctrl0;
    hw_dcp_packet2_t  ctrl1;
    u32          *src,
                *dst,
                buf_size,
                *payload,
                stat;
} DCP_DESCRIPTOR;

DCP_DESCRIPTOR dcp1;
u32 *srcbuffer;
u32 payload[5];
// set up expected hash check value
payload[0]=0x01234567;
payload[1]=0x89ABCDEF;
payload[2]=0x00112233;
payload[3]=0x44556677;
payload[4]=0x8899aabb;
// set up control packet
dcp1.next = 0; // single packet in chain
dcp1.ctrl0.U = 0; // clear ctrl0 field
dcp1.ctrl0.B.HASH_CHECK = 1; // check hash when complete
dcp1.ctrl0.B.HASH_INIT = 1; // initialize hash with this block
dcp1.ctrl0.B.HASH_TERM = 1; // terminate hash with this block
dcp1.ctrl0.B.ENABLE_HASH = 1; // enable hash
dcp1.ctrl0.B.DECR_SEMAPHORE = 1; // decrement semaphore
dcp1.ctrl0.B.INTERRUPT = 1; // interrupt
dcp1.ctrl1.U = 0; // clear ctrl1
dcp1.src = srcbuffer; // source buffer
```

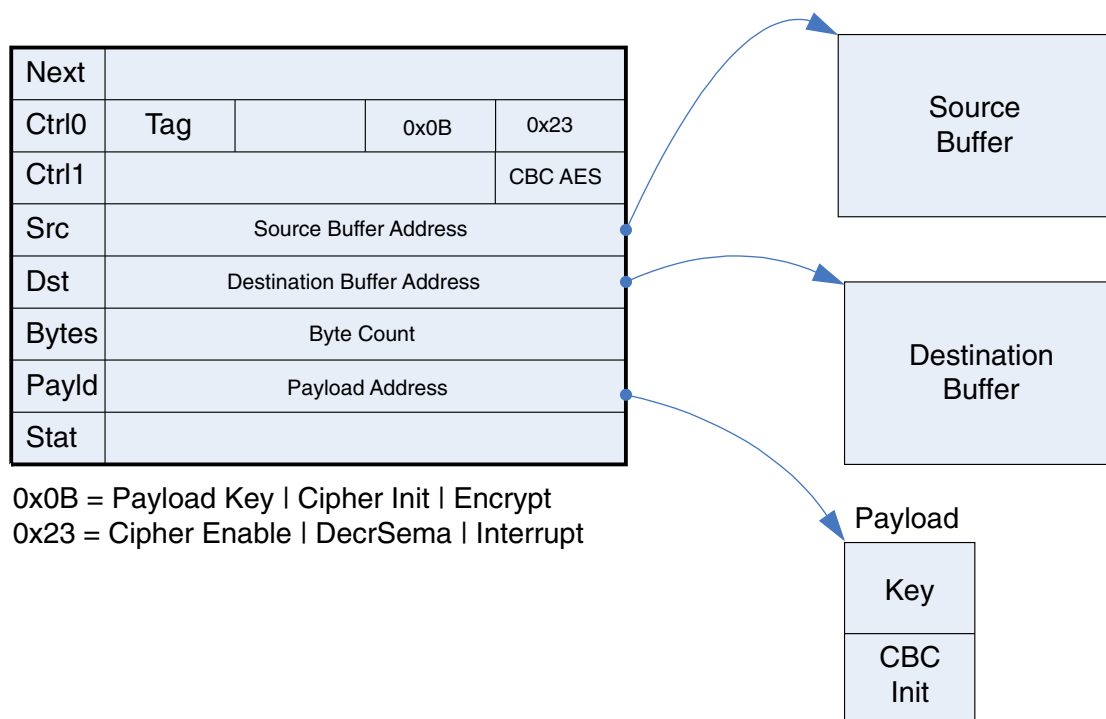

```

dcp1.dst = 0;                // no destination buffer
dcp1.buf_size = 512;         // 512 bytes
dcp1.payload = payload;      // holds expected hash value
dcp1.status = 0;             // clear status
// Enable channel 0
HW_DCP_CHnCMDPTR_WR(0, dcp1); // write packet address to pointer register
HW_DCP_CHnSEMA_WR(0, 1);      // increment semaphore by 1
// now wait for interrupt or poll
// polling code
while ( (HW_DCP_STAT_RD() & 0x01) == 0x00 );
// now check/clear channel status
if ( (HW_DCP_CHnSTAT_RD(0) & 0xFF) != 0 ) {
    // an error occurred
    HW_DCP_CHnSTAT_CLR(0, 0xff);
}
// clear interrupt register
HW_DCP_STAT_CLR(1);
</code>

```

### 18.3.7.3 Basic Cipher Operation Programming Example

To perform a basic cipher operation, only a single descriptor is required. The DCP reads data from the source buffer, encrypts it, and writes it to the destination buffer. For this example, the key is provided in the payload and the algorithm uses the AES CBC mode of operation. This requires a payload with both the key and CBC initialization value. This process is illustrated in [Figure 18-8](#).

**Figure 18-8. Basic Cipher Operation**

```

<code>
typedef struct _dcp_descriptor
{
    u32                *next;

```

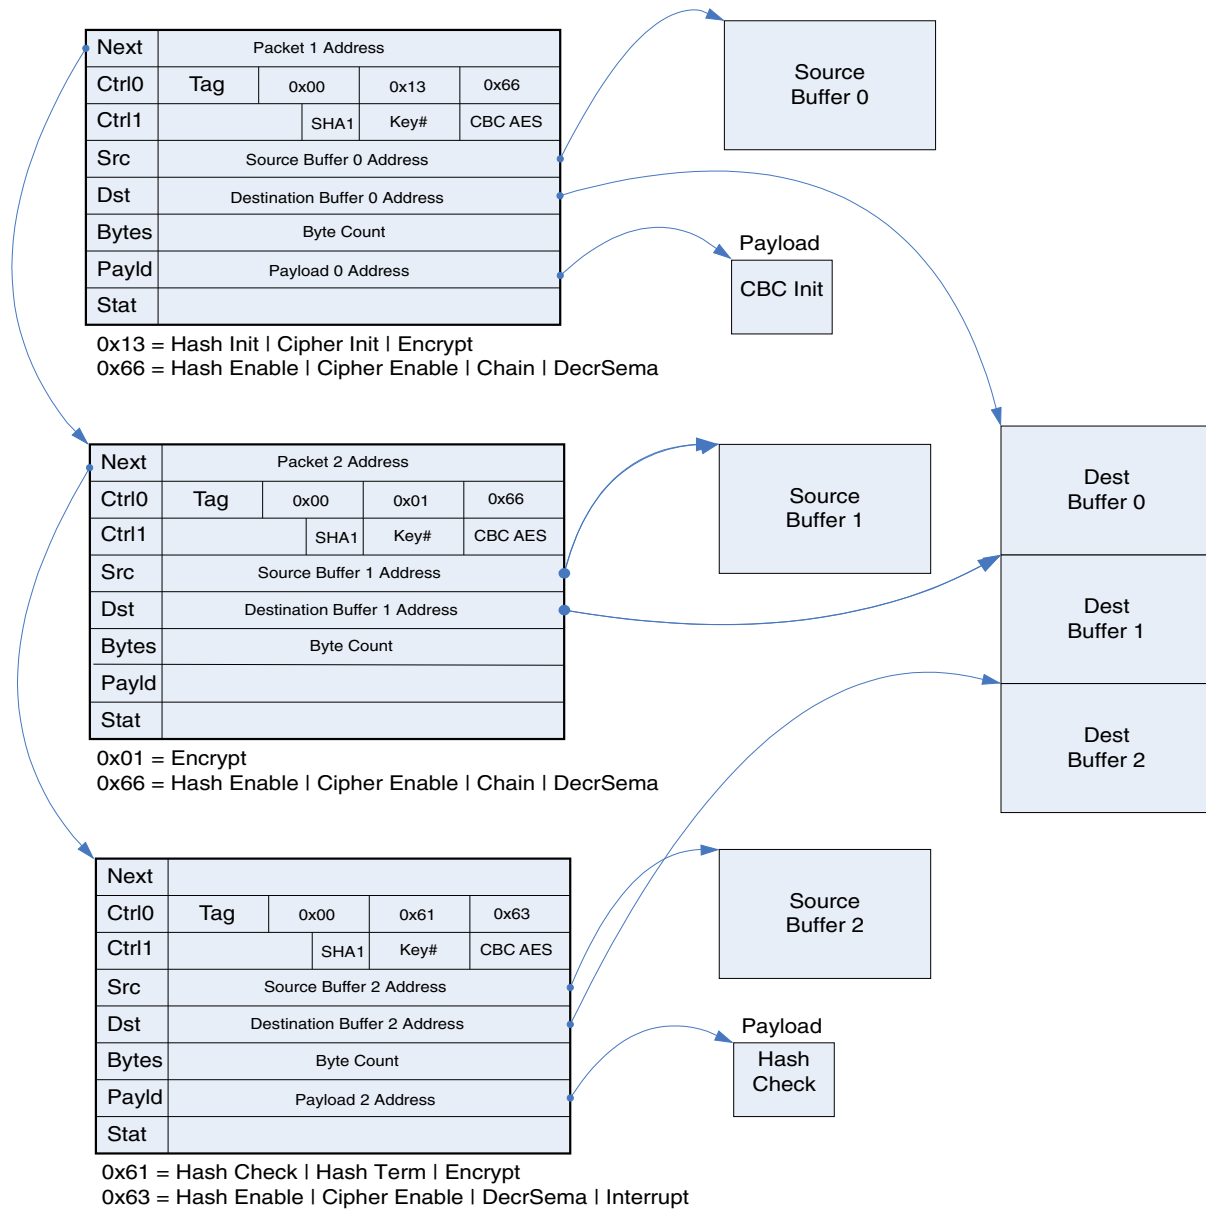

## Operation

```
hw_dcp_packet1_t  ctrl0;
hw_dcp_packet2_t  ctrl1;
u32               *src,
                  *dst,
                  buf_size,
                  *payload,
                  stat;
} DCP_DESCRIPTOR;
DCP_DESCRIPTOR dcp1;
u32 *srcbuffer;
u32 *dstbuffer;
u32 payload[8];
// set up key/CBC init in the payload
payload[0]=0x01234567;          // key
payload[1]=0x89ABCDEF;
payload[2]=0xfedcba98;
payload[3]=0x76543210;
payload[4]=0x00112233;          // CBC initialization
payload[5]=0x44556677;
payload[6]=0x8899aabb;
payload[7]=0xccddeeff;
// set up control packet
dcp1.next = 0;                  // single packet in chain
dcp1.ctrl0.U = 0;               // clear ctrl0 field
dcp1.ctrl0.B.PAYLOAD_KEY = 1;   // key is located in payload
dcp1.ctrl0.B.CIPHER_ENCRYPT = 1; // encryption operation
dcp1.ctrl0.B.CIPHER_INIT = 1;  // init CBC for this block (from payload)
dcp1.ctrl0.B.ENABLE_CIPHER = 1; // enable cipher
dcp1.ctrl0.B.DECR_SEMAPHORE = 1; // decrement semaphore
dcp1.ctrl0.B.INTERRUPT = 1;    // interrupt
dcp1.ctrl1.U = 0;              // clear ctrl1
dcp1.ctrl1.B.CIPHER_MODE = 1;  // select CBC mode of operation
dcp1.src = srcbuffer;           // source buffer
dcp1.dst = dstbuffer;           // destination buffer
dcp1.buf_size = 512;            // 512 bytes
dcp1.payload = payload;         // holds key/CBC init
dcp1.status = 0;                // clear status
// Enable channel 0
HW_DCP_CHnCMDPTR_WR(0, dcp1);  // write packet address to pointer register
HW_DCP_CHnSEMA_Wr(0, 1);        // increment semaphore by 1
// now wait for interrupt or poll
// polling code
while ( (HW_DCP_STAT_RD() & 0x01) == 0x00 );
// now check/clear channel status
if ( (HW_DCP_CHnSTAT_RD(0) & 0xFF) != 0 ) {
    // an error occurred
    HW_DCP_CHnSTAT_CLR(0, 0xff);
}
// clear interrupt register
HW_DCP_STAT_CLR(1);
</code>
```

### 18.3.7.4 Multi-Buffer Scatter/Gather Cipher and Hash Operation Programming Example

For this example, three separate buffers are encrypted and hashed with the results being directed to a unified buffer (gather operation). Three descriptors are used for the operation because there are three separate source buffer pointers. The DCP reads data from the source buffer and computes a hash on the unencrypted data. It then encrypts the data and writes it to the destination buffer. For this example, the key is located in the key RAM, and the algorithm uses the AES CBC mode of operation with a SHA-1 hash. The

payload for the first operation contains the CBC initialization value, and the payload for the last packet contains the expected hash value. The middle packet requires no payload. This process is illustrated in Figure 18-9.

**Figure 18-9. Multi-Buffer Scatter/Gather Cipher and Hash Operation**

```
<code>
typedef struct _dcp_descriptor
{
    u32          *next;
    hw_dcp_packet1_t ctrl0;
    hw_dcp_packet2_t ctrl1;
    u32          *src,
                *dst,
                buf_size,
                *payload,
                stat;
} DCP_DESCRIPTOR;
DCP_DESCRIPTOR dcp1, dcp2, dcp3;
```

## Operation

```
u32 *srcbuffer0, *srcbuffer2, *srcbuffer3;
u32 *dstbuffer;
u32 payload0[4], payload2[5];
// set up CBC init in the payload
payload0[0]=0x01234567;           // key
payload0[1]=0x89ABCDEF;
payload0[2]=0xfedcba98;
payload0[3]=0x76543210;
payload2[0]=0x00112233;           // CBC initialization

### 18.4.1 DCP Control Register 0 (DCP\_CTRL)

The CTRL register contains controls for the DCP module.

CTRL: 0x000

CTRL\_SET: 0x004

CTRL\_CLR: 0x008

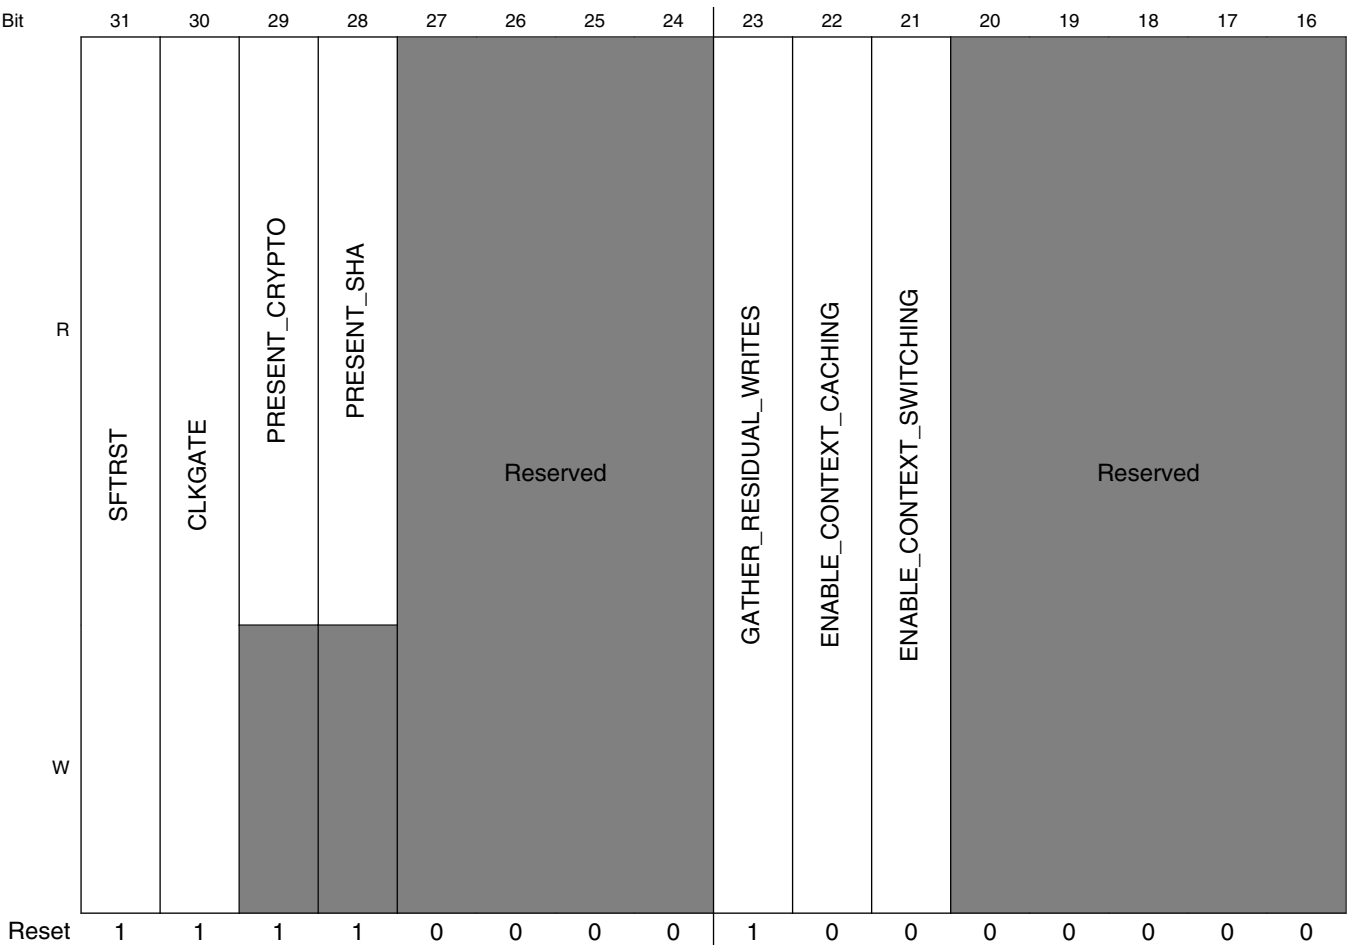

CTRL\_TOG: 0x00C

The Control register contains the primary controls for the DCP block. The present bits indicate which of the sub-features of the block are present in the hardware. The context control bits control how the DCP utilizes it's context buffer and the gather residual writes bit controls how the master handles writing misaligned data to the bus. Each channel and the color-space converter contains an independent interrupt enable.

EXAMPLE

```
DCP_CTRL_SET(BM_DCP_CTRL_SFTRST);
DCP_CTRL_CLR(BM_DCP_CTRL_SFTRST | BM_DCP_CTRL_CLKGATE);
```

Address: 20F\_C000h base + 0h offset = 20F\_C000h

## DCP Memory Map/Register Definition

### DCP\_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal DCP operation. Set this bit to one (default) to disable clocking with the DCP and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the DCP block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 PRESENT_CRYPTO	Indicates whether the crypto (Cipher/Hash) functions are present. 0x1 <b>Present</b> — 0x0 <b>Absent</b> —
28 PRESENT_SHA	Indicates whether the SHA1/SHA2 functions are present. 0x1 <b>Present</b> — 0x0 <b>Absent</b> —
27–24 -	This field is reserved. Reserved, always set to zero.
23 GATHER_RESIDUAL_WRITES	Software should set this bit to enable ragged writes to unaligned buffers to be gathered between multiple write operations. This improves performance by removing several byte operations between write bursts. Trailing byte writes are held in a residual write data buffer and combined with a subsequent write to the buffer to form a word write.
22 ENABLE_CONTEXT_CACHING	Software should set this bit to enable caching of contexts between operations. If only a single channel is used for encryption/hashing, enabling caching causes the context to not be reloaded if the channel was the last to be used.
21 ENABLE_CONTEXT_SWITCHING	Enable automatic context switching for the channels. Software should set this bit if more than one channel is doing hashing or cipher operations that require context to be saved (for instance, when CBC mode is enabled). By disabling context switching, software can save the 208 bytes used for the context buffer.

Table continues on the next page...

**DCP\_CTRL field descriptions (continued)**

Field	Description
20–9 -	This field is reserved. Reserved, always set to zero.
8 RSVD_CSC_ INTERRUPT_ ENABLE	This field is reserved. Reserved, always set to zero.
7–0 CHANNEL_ INTERRUPT_ ENABLE	Per-channel interrupt enable bit. When set, the channel's interrupt will get routed to the interrupt controller. Channel 0 is routed to the dcp_vmi_irq signal and the other channels are combined (along with the CRC interrupt) into the dcp_irq signal.  0x01 <b>CH0</b> — 0x02 <b>CH1</b> — 0x04 <b>CH2</b> — 0x08 <b>CH3</b> —

**18.4.2 DCP Status Register (DCP\_STAT)**

The DCP Interrupt Status register provides channel interrupt status information.

STAT: 0x010

STAT\_SET: 0x014

STAT\_CLR: 0x018

STAT\_TOG: 0x01C

This register provides status feedback indicating the channel currently performing an operation and which channels have pending operations.

**EXAMPLE**

## DCP Memory Map/Register Definition

Address: 20F\_C000h base + 10h offset = 20F\_C010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved			OTP_KEY_READY	CUR_CHANNEL				READY_CHANNELS							
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved							Reserved	Reserved				IRQ			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**DCP\_STAT field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28 OTP_KEY_READY	When set, indicates that the OTP key has been shifted from the fuse block and is ready for use.
27–24 CUR_CHANNEL	Current (active) channel (encoded).  0x0 <b>None</b> — 0x1 <b>CH0</b> — 0x2 <b>CH1</b> — 0x3 <b>CH2</b> — 0x4 <b>CH3</b> —
23–16 READY_CHANNELS	Indicates which channels are ready to proceed with a transfer (active channel also included). Each bit is a one-hot indicating the request status for the associated channel.  0x01 <b>CH0</b> — 0x02 <b>CH1</b> — 0x04 <b>CH2</b> — 0x08 <b>CH3</b> —
15–9 -	This field is reserved. Reserved, always set to zero.
8 RSVD_IRQ	This field is reserved. Reserved, always set to zero.
7–4 -	This field is reserved. Reserved, always set to zero.
3–0 IRQ	Indicates which channels have pending interrupt requests. Channel 0's interrupt is routed through the dcp_vmi_irq and the other interrupt bits are routed through the dcp_irq.

**18.4.3 DCP Channel Control Register (DCP\_CHANNELCTRL)**

The DCP Channel Control register provides controls for channel arbitration and channel enables.

CHANNELCTRL: 0x020

CHANNELCTRL\_SET: 0x024

CHANNELCTRL\_CLR: 0x028

CHANNELCTRL\_TOG: 0x02C

This register provides status feedback indicating the channel currently performing an operation and which channels have pending operations.

**EXAMPLE**

## DCP Memory Map/Register Definition

```
BW_DCP_CHANNELCTRL_ENABLE_CHANNEL(BV_DCP_CHANNELCTRL_ENABLE_CHANNEL__CH0); //
enable channel 0
```

Address: 20F\_C000h base + 20h offset = 20F\_C020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															CH0_IRQ_MERGED
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	HIGH_PRIORITY_CHANNEL								ENABLE_CHANNEL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### DCP\_CHANNELCTRL field descriptions

Field	Description
31–17 RSVD	This field is reserved. Reserved, always set to zero.
16 CH0_IRQ_MERGED	Indicates that the interrupt for channel 0 should be merged with the other interrupts on the shared dcp_irq interrupt. When set to 0, channel 0's interrupt will be routed to the separate dcp_vmi_irq. When set to 1, the interrupt will be routed to the shared DCP interrupt.
15–8 HIGH_PRIORITY_CHANNEL	Setting a bit in this field causes the corresponding channel to have high-priority arbitration. High priority channels will be arbitrated round-robin and will take precedence over other channels that are not marked as high priority.  0x01 <b>CH0</b> — 0x02 <b>CH1</b> — 0x04 <b>CH2</b> — 0x08 <b>CH3</b> —
7–0 ENABLE_CHANNEL	Setting a bit in this field will enabled the DMA channel associated with it. This field is a direct input to the DMA channel arbiter. When not enabled, the channel is denied access to the central DMA resources.  0x01 <b>CH0</b> — 0x02 <b>CH1</b> — 0x04 <b>CH2</b> — 0x08 <b>CH3</b> —

### 18.4.4 DCP Capability 0 Register (DCP\_CAPABILITY0)

This register contains additional information about the DCP module implementation parameters.

This register provides capability information for the DCP block. It indicates the number of channels implemented as well as the number of key storage locations available for software use.

Address: 20F\_C000h base + 30h offset = 20F\_C030h

DCP\_CAPABILITY0 field descriptions

Field	Description
31 DISABLE_DECRYPT	Write to a 1 to disable decryption. This bit can only be written by secure software and the value can only be cleared by a reset.

Table continues on the next page...

**DCP\_CAPABILITY0 field descriptions (continued)**

Field	Description
30 Reserved	This field is reserved. -
29 DISABLE_UNIQUE_KEY	Write to a 1 disable the per-device unique key. The device-specific hardware key may be selected by using a value of 0xFE in the key select field.
28–12 RSVD	This field is reserved. Reserved, always set to zero.
11–8 NUM_CHANNELS	Encoded value indicating the number of channels implemented in the design.
7–0 NUM_KEYS	Encoded value indicating the number of key storage locations implemented in the design.

**18.4.5 DCP Capability 1 Register (DCP\_CAPABILITY1)**

This register contains information about the algorithms available on the implementation.

This register provides capability information for the DCP block. It contains two fields indicating which encryption and hashing algorithms are present in the design. Each bit set indicates that support for the associated function is present.

Address: 20F\_C000h base + 40h offset = 20F\_C040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	HASH_ALGORITHMS																CIPHER_ALGORITHMS															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**DCP\_CAPABILITY1 field descriptions**

Field	Description
31–16 HASH_ALGORITHMS	One-hot field indicating which hashing features are implemented in HW. 0x0001 <b>SHA1</b> — 0x0002 <b>CRC32</b> — 0x0004 <b>SHA256</b> —
15–0 CIPHER_ALGORITHMS	One-hot field indicating which cipher algorithms are available. 0x0001 <b>AES128</b> —

### 18.4.6 DCP Context Buffer Pointer (DCP\_CONTEXT)

This register contains a pointer to the memory region to be used for DCP context swap operations.

This register contains a pointer to the start of the context pointer memory in on-chip SRAM or off-chip SDRAM. This buffer will be used to store state information when the DCP module changes from one channel to another.

Address: 20F\_C000h base + 50h offset = 20F\_C050h

**DCP\_CONTEXT field descriptions**

Field	Description
31–0 ADDR	Context pointer address. Address should be located in system RAM and should be word-aligned for optimal performance.

### 18.4.7 DCP Key Index (DCP\_KEY)

This register contains a pointer to the key location to be written.

The DCP module maintains a set of write-only keys that may be used by software. To write a key, software must first write the desired key index/subword to this register and then write the key values to the key registers (below). After each write to the key data register, the SUBWORD field will increment to allow software to write the subsequent key to be written without having to rewrite the key index.

#### EXAMPLE

```
// write key 0 to 0x00112233_44556677_8899aabb_ccddeeff
DCP_KEY_WR(BF_DCP_KEY_INDEX(0) | BF_DCP_KEY_SUBWORD(0)); // set key index to key 0, subword
0
DCP_KEYDATA_WR(0xccddeeff); // write key values (subword 0)
DCP_KEYDATA_WR(0x8899aabb); // write key values (subword 1)
DCP_KEYDATA_WR(0x44556677); // write key values (subword 2)
DCP_KEYDATA_WR(0x00112233); // write key values (subword 3)
```

Address: 20F\_C000h base + 60h offset = 20F\_C060h

## DCP Memory Map/Register Definition

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								Reserved		INDEX		Reserved		SUBWORD	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### DCP\_KEY field descriptions

Field	Description
31–8 RSVD	This field is reserved. Reserved, always set to zero.
7–6 RSVD_INDEX	This field is reserved. Reserved, always set to zero.
5–4 INDEX	Key index pointer. Valid indices are 0-[number_keys].
3–2 RSVD_SUBWORD	This field is reserved. Reserved, always set to zero.
1–0 SUBWORD	Key subword pointer. Valid indices are 0-3. After each write to the key data register, this field will increment.

## 18.4.8 DCP Key Data (DCP\_KEYDATA)

This register provides write access to the key/key subword specified by the Key Index Register.

Writing this location updates the selected subword for the key located at the index specified by the Key Index Register. A write also triggers the SUBWORD field of the KEY register to increment to the next higher word in the key.

### EXAMPLE

```
// write key 0 to 0x00112233_44556677_8899aabb_ccddeeff
DCP_KEY_WR(BF_DCP_KEY_INDEX(0) | BF_DCP_KEY_SUBWORD(0)); // set key index to key 0, subword
0
DCP_KEYDATA_WR(0xccddeeff); // write key values (subword 0)
DCP_KEYDATA_WR(0x8899aabb); // write key values (subword 1)
DCP_KEYDATA_WR(0x44556677); // write key values (subword 2)
DCP_KEYDATA_WR(0x00112233); // write key values (subword 3)
```

Address: 20F\_C000h base + 70h offset = 20F\_C070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**DCP\_KEYDATA field descriptions**

Field	Description
31–0 DATA	Word 0 data for key. This is the least-significant word.

**18.4.9 DCP Work Packet 0 Status Register (DCP\_PACKET0)**

This register displays the values for the current work packet offset 0x00 (Next Command) field.

The Work Packet Status Registers show the contents of the currently executing packet. When the channels are inactive, the packet status register return 0. The register bits are fully documented here to document the packet structure in memory.

Address: 20F\_C000h base + 80h offset = 20F\_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DCP\_PACKET1 field descriptions

Field	Description
31–24 TAG	Packet Tag
23 OUTPUT_ WORDSWAP	Reflects whether the DCP engine will wordswap output data (big-endian data).
22 OUTPUT_ BYTESWAP	Reflects whether the DCP engine will byteswap output data (big-endian data).
21 INPUT_ WORDSWAP	Reflects whether the DCP engine will wordswap input data (big-endian data).
20 INPUT_ BYTESWAP	Reflects whether the DCP engine will byteswap input data (big-endian data).
19 KEY_ WORDSWAP	Reflects whether the DCP engine will swap key words (big-endian key).
18 KEY_ BYTESWAP	Reflects whether the DCP engine will swap key bytes (big-endian key).

Table continues on the next page...

## DCP\_PACKET1 field descriptions (continued)

Field	Description
17 TEST_SEMA_ IRQ	This bit is used to test the channel semaphore transition to 0. FOR TEST USE ONLY!
16 CONSTANT_ FILL	When this bit is set (MEMCOPY and BLIT modes only), the DCP will simply fill the destination buffer with the value found in the Source Address field.
15 HASH_OUTPUT	When hashing is enabled, this bit controls whether the input or output data is hashed. 0 <b>INPUT</b> — 1 <b>OUTPUT</b> —
14 CHECK_HASH	Reflects whether the calculated hash value should be compared against the hash provided in the payload.
13 HASH_TERM	Reflects whether the current hashing block is the final block in the hashing operation, so the hash padding should be applied by hardware.
12 HASH_INIT	Reflects whether the current hashing block is the initial block in the hashing operation, so the hash registers should be initialized before the operation.
11 PAYLOAD_KEY	When set, indicates the payload contains the key. This bit takes precedence over the OTP_KEY control
10 OTP_KEY	Reflects whether a hardware-based key should be used. The KEY_SELECT field from the Control1 field is used to select from multiple hardware keys. The PAYLOAD_KEY bit takes precedence over the OTP_KEY bit.
9 CIPHER_INIT	Reflects whether the cipher block should load the initialization vector from the payload for this operation.
8 CIPHER_ ENCRYPT	When the cipher block is enabled, this bit indicates whether the operation is encryption or decryption. 1 <b>ENCRYPT</b> — 0 <b>DECRYPT</b> —
7 ENABLE_BLIT	Reflects whether the DCP should perform a blit operation. Source data is always continuous and the destination buffer is written in run/stride format. When set, the BUFFER_SIZE field is treated as two 16-bit values for the X-Y extents of the blit operation.
6 ENABLE_HASH	Reflects whether the selected hashing function should be enabled for this operation.
5 ENABLE_ CIPHER	Reflects whether the selected cipher function should be enabled for this operation.
4 ENABLE_ MEMCOPY	Reflects whether the selected hashing function should be enabled for this operation.
3 CHAIN_ CONTIGUOUS	Reflects whether the next packet's address is located following this packet's payload.
2 CHAIN	Reflects whether the next command pointer register should be loaded into the channel's current descriptor pointer.
1 DECR_ SEMAPHORE	Reflects whether the channel's semaphore should be decremented at the end of the current operation. When the semaphore reaches a value of zero, no more operations will be issued from the channel.

*Table continues on the next page...*

**DCP\_PACKET1 field descriptions (continued)**

Field	Description
0 INTERRUPT	Reflects whether the channel should issue an interrupt upon completion of the packet.

**18.4.11 DCP Work Packet 2 Status Register (DCP\_PACKET2)**

This register displays the values for the current work packet offset 0x08 (Control1) field.

This register shows the contents of the Control0 register from the packet being processed.

Address: 20F\_C000h base + A0h offset = 20F\_C0A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CIPHER_CFG								Reserved				HASH_SELECT			
W

**DCP\_PACKET2 field descriptions**

Field	Description
31–24 CIPHER_CFG	Cipher configuration bits. Optional configuration bits required for ciphers
23–20 RSVD	This field is reserved. Reserved, always set to zero.
19–16 HASH_SELECT	Hash Selection Field 0x00 <b>SHA1</b> — 0x01 <b>CRC32</b> — 0x02 <b>SHA256</b> —
15–8 KEY_SELECT	Key Selection Field. The value here reflects the key index for the cipher operation. Values 0-3 refer to the software keys that can be written to the key RAM. The OTP key or the unique device-specific key may also be selected with a value of 0xFF (OTP key) or 0xFE (unique key). 0x00 <b>KEY0</b> — 0x01 <b>KEY1</b> — 0x02 <b>KEY2</b> — 0x03 <b>KEY3</b> — 0xFE <b>UNIQUE_KEY</b> — 0xFF <b>OTP_KEY</b> —
7–4 CIPHER_MODE	Cipher Mode Selection Field. Reflects the mode of operation for cipher operations.

Table continues on the next page...

**DCP\_PACKET2 field descriptions (continued)**

Field	Description
	0x00 <b>ECB</b> — 0x01 <b>CBC</b> —
3–0 CIPHER_SELECT	Cipher Selection Field 0x00 <b>AES128</b> —

**18.4.12 DCP Work Packet 3 Status Register (DCP\_PACKET3)**

This register displays the values for the current work packet offset 0x0C (Source Address) field.

This register shows the contents of the Source Address register from the packet being processed. When the **CONSTANT\_FILL** bit in the Control 0 field is set, this field contains the data written to the destination buffer.

Address: 20F\_C000h base + B0h offset = 20F\_C0B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ADDR																															
W

**DCP\_PACKET4 field descriptions**

Field	Description
31–0 ADDR	Destination Buffer Address Pointer. This value is the working value and will update as the operation proceeds.

**18.4.14 DCP Work Packet 5 Status Register (DCP\_PACKET5)**

This register displays the values for the current work packet offset 0x14 (Buffer Size) field.

This register shows the contents of the bytecount register from the packet being processed. The field can be considered either a byte count or a buffer size. The logic treats this as a decrementing count of bytes from the buffer size programmed into the field. As the transaction proceeds, the logic will decrement the bytecount as data is written to the destination buffer. For blit operations, the top 16-bits of this field represents the number of lines (y size) in the blit and the lower 16-bits represent the number of bytes in a line (x size).

Address: 20F\_C000h base + D0h offset = 20F\_C0D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### DCP\_PACKET6 field descriptions

Field	Description
31–0 ADDR	This register reflects the payload pointer for the current control packet.

## 18.4.16 DCP Channel 0 Command Pointer Address Register (DCP\_CH0CMDPTR)

The DCP channel 0 current command address register points to the multiword descriptor that is to be executed (or currently being executed). The channel may be activated by writing the command pointer address to a valid descriptor in memory and then updating the semaphore to a non-zero value. After the engine completes processing of a descriptor, the "next\_ptr" field from the descriptor is moved into this register to enable processing of the next descriptor. All channels with a non-zero semaphore value will arbitrate for access to the engine for the subsequent operation.

DCP Channel 0 is controlled by a variable sized command structure. This register points to the command structure to be executed.

### EXAMPLE

```
DCP_CHnCMDPTR_WR(0, v);    // Write channel 0 command pointer
pCurptr = (DCP_chncmdptr_t *) DCP_CHnCMDPTR_RD(0); // Read current command
pointer
```

Address: 20F\_C000h base + 100h offset = 20F\_C100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### DCP\_CH0CMDPTR field descriptions

Field	Description
31–0 ADDR	Pointer to descriptor structure to be processed for channel 0.

### 18.4.17 DCP Channel 0 Semaphore Register (DCP\_CH0SEMA)

The DCP Channel 0 semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state. After a command chain has been generated in memory, software should write the address of the first command descriptor to the CMDPTR register and then write a non-zero value to the semaphore register to indicate that the channel is active. Each command packet has a chaining bit which indicates that another descriptor should be loaded into the channel upon completion of the current descriptor. If the chaining bit is not set, the next address will not be loaded into the CMDPTR register. Each packet also contains a "decrement semaphore" bit, which indicates that the counting semaphore should be decremented after the operation. A channel is considered active when the semaphore is a non-zero value. When programming a series operations, software must properly program the semaphore values in conjunction with the "decrement\_semaphore" bits in the control packets to ensure that the proper number of descriptors are activated. A semaphore may be cleared by software by writing 0xFF to the DCP\_CHnSEMA\_CLR register. The logic will also clear the semaphore if an error has occurred.

Each DCP channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DCP chain processing. After processing each control packet, the DCP decrements the semaphore if it is non-zero. The channel will continue processing packets as long as the semaphore contains a non-zero value and the CHAIN or CHAIN\_CONTIGUOUS control bits in the Control0 field are set.

Address: 20F\_C000h base + 110h offset = 20F\_C110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**DCP\_CH0SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 VALUE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
7–0 INCREMENT	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DCP hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DCP channel decrements the count on the same clock, then the count is incremented by a net one. The semaphore may be cleared by writing 0xFF to the DCP_CHnSEMA_CLR register.

18.4.18 DCP Channel 0 Status Register (DCP\_CH0STAT)

The DCP Channel 0 Interrupt Status register contains the interrupt status bit and the tag of the last completed operation from the command chain. If an error occurs during processing, the ERROR bit is set and an interrupt is generated.

DCP\_CH0STAT: 0x120

CH0STAT\_SET: 0x124

CH0STAT\_CLR: 0x128

CH0STAT\_TOG: 0x12C

The interrupt status register is updated at the end of each work packet. If the interrupt bit is set in the command packet's command field, an interrupt will be generated once the packet has completed. In addition, the tag value from the command is stored in the TAG field so that software can identify which command structure was the last to complete. If an error occurs, the ERROR bit is set and processing of the command chain is halted.

Address: 20F\_C000h base + 120h offset = 20F\_C120h

DCP\_CH0STAT field descriptions

Field	Description
31–24 TAG	Indicates the tag from the last completed packet in the command structure
23–16 ERROR_CODE	Indicates additional error codes for some error conditions. 0x01 <b>NEXT_CHAIN_IS_0</b> — Error signalled because the next pointer is 0x00000000 0x02 <b>NO_CHAIN</b> — Error signalled because the semaphore is nonzero and neither chain bit is set 0x03 <b>CONTEXT_ERROR</b> — Error signalled because an error was reported reading/writing the context buffer 0x04 <b>PAYLOAD_ERROR</b> — Error signalled because an error was reported reading/writing the payload 0x05 <b>INVALID_MODE</b> — Error signalled because the control packet specifies an invalid mode select (for instance, blit + hash)
15–7 -	This field is reserved. Reserved, always set to zero.
6 ERROR_PAGEFAULT	This bit indicates a page fault occurred while converting a virtual address to a physical address.. When an error is detected, the channel's processing will stop until the error handled by software.
5 ERROR_DST	This bit indicates a bus error occurred when storing to the destination buffer. When an error is detected, the channel's processing will stop until the error handled by software.
4 ERROR_SRC	This bit indicates a bus error occurred when reading from the source buffer. When an error is detected, the channel's processing will stop until the error handled by software.
3 ERROR_PACKET	This bit indicates that a a bus error occurred when reading the packet or payload or when writing status back to the packet payload. When an error is detected, the channel's processing will stop until the error is handled by software.
2 ERROR_SETUP	This bit indicates that the hardware has detected an invalid programming configuration such as a buffer length that is not a multiple of the natural data size for the operation. When an error is detected, the channel's processing will stop until the error is handled by software.

Table continues on the next page...

**DCP\_CH0STAT field descriptions (continued)**

Field	Description
1 HASH_ MISMATCH	The bit indicates that a hashing check operation mismatched for control packets that enable the HASH_CHECK bit. When an error is detected, the channel's processing will stop until the error is handled by software.
0 RSVD_ COMPLETE	This field is reserved. This bit will always read 0 in the status register, but will be set to 1 in the packet status field after processing of the packet has completed. This was done so that software can verify that each packet completed properly in a chain of commands for cases when an interrupt is issued only for the last item in a packet. The completion bit for the channel is effectively the channel interrupt status bit.

**18.4.19 DCP Channel 0 Options Register (DCP\_CH0OPTS)**

The DCP Channel 0 Options Status register contains optional control information that may be used to further tune the behavior of the channel.

DCP\_CH0OPTS: 0x130

CH0OPTS\_SET: 0x134

CH0OPTS\_CLR: 0x138

CH0OPTS\_TOG: 0x13C

The options register can be used to control optional features of the channels.

Address: 20F\_C000h base + 130h offset = 20F\_C130h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																RECOVERY_TIMER															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**DCP\_CH0OPTS field descriptions**

Field	Description
31–16 RSVD	This field is reserved. Reserved, always set to zero.
15–0 RECOVERY_ TIMER	This field indicates the recovery time for the channel. After each operation, the recover timer for the channel is initialized with this value and then decremented until the timer reaches zero. The channel will not initiate another operation for the next packet in the chain until the recovery time has been satisfied. The timebase for the recovery timer is 16 HCLK clock cycles, providing a range of 0ns to 8.3ms at 133 MHz operation.

### 18.4.20 DCP Channel 1 Command Pointer Address Register (DCP\_CH1CMDPTR)

The DCP channel 1 current command address register points to the multiword descriptor that is to be executed (or currently being executed). The channel may be activated by writing the command pointer address to a valid descriptor in memory and then updating the semaphore to a non-zero value. After the engine completes processing of a descriptor, the "next\_ptr" field from the descriptor is moved into this register to enable processing of the next descriptor. All channels with a non-zero semaphore value will arbitrate for access to the engine for the subsequent operation.

DCP Channel 1 is controlled by a variable sized command structure. This register points to the command structure to be executed.

#### EXAMPLE

```

DCP_CHn_CMDPTR_WR(1, v); // Write channel 1 command pointer
pCurptr = (DCP_chn_cmdptr_t *) DCP_CHn_CMDPTR_RD(1); // Read current command
pointer
    
```

Address: 20F\_C000h base + 140h offset = 20F\_C140h

DCP\_CH1CMDPTR field descriptions

Field	Description
31–0 ADDR	Pointer to descriptor structure to be processed for channel 1.

## 18.4.21 DCP Channel 1 Semaphore Register (DCP\_CH1SEMA)

The DCP Channel 1 semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state. After a command chain has been generated in memory, software should write the address of the first command descriptor to the CMDPTR register and then write a non-zero value to the semaphore register to indicate that the channel is active. Each command packet has a chaining bit which indicates that another descriptor should be loaded into the channel upon completion of the current descriptor. If the chaining bit is not set, the next address will not be loaded into the CMDPTR register. Each packet also contains a "decrement semaphore" bit, which indicates that the counting semaphore should be decremented after the operation. A channel is considered active when the semaphore is a non-zero value. When programming a series operations, software must properly program the semaphore values in conjunction with the "decrement\_semaphore" bits in the control packets to ensure that the proper number of descriptors are activated. A semaphore may be cleared by software by writing 0xFF to the DCP\_CHnSEMA\_CLR register. The logic will also clear the semaphore if an error has occurred.

Each DCP channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DCP chain processing. DCP processing continues until the engine attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DCP channel is stalled until software increments the semaphore count.

Address: 20F\_C000h base + 150h offset = 20F\_C150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								VALUE								Reserved								INCREMENT							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**DCP\_CH1SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 VALUE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
7–0 INCREMENT	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DCP hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DCP channel decrements the count on the same clock, then the count is incremented by a net one. The semaphore may be cleared by writing 0xFF to the DCP_CHnSEMA_CLR register.

### 18.4.22 DCP Channel 1 Status Register (DCP\_CH1STAT)

The DCP Channel 1 Interrupt Status register contains the interrupt status bit and the tag of the last completed operation from the command chain. If an error occurs during processing, the ERROR bit is set and an interrupt is generated.

CH1STAT: 0x160

CH1STAT\_SET: 0x164

CH1STAT\_CLR: 0x168

CH1STAT\_TOG: 0x16C

The interrupt status register is updated at the end of each work packet. If the interrupt bit is set in the command packet's command field, an interrupt will be generated once the packet has completed. In addition, the tag value from the command is stored in the TAG field so that software can identify which command structure was the last to complete. If an error occurs, the ERROR bit is set and processing of the command chain is halted.

Address: 20F\_C000h base + 160h offset = 20F\_C160h

## DCP Memory Map/Register Definition

### DCP\_CH1STAT field descriptions

Field	Description
31–24 TAG	Indicates the tag from the last completed packet in the command structure
23–16 ERROR_CODE	Indicates additional error codes for some error conditions. 0x01 <b>NEXT_CHAIN_IS_0</b> — Error signalled because the next pointer is 0x00000000 0x02 <b>NO_CHAIN</b> — Error signalled because the semaphore is nonzero and neither chain bit is set 0x03 <b>CONTEXT_ERROR</b> — Error signalled because an error was reported reading/writing the context buffer 0x04 <b>PAYLOAD_ERROR</b> — Error signalled because an error was reported reading/writing the payload 0x05 <b>INVALID_MODE</b> — Error signalled because the control packet specifies an invalid mode select (for instance, blit + hash)
15–7 -	This field is reserved. Reserved, always set to zero.
6 ERROR_PAGEFAULT	This bit indicates a page fault occurred while converting a virtual address to a physical address.. When an error is detected, the channel's processing will stop until the error handled by software.
5 ERROR_DST	This bit indicates a bus error occurred when storing to the destination buffer. When an error is detected, the channel's processing will stop until the error handled by software.
4 ERROR_SRC	This bit indicates a bus error occurred when reading from the source buffer. When an error is detected, the channel's processing will stop until the error handled by software.
3 ERROR_PACKET	This bit indicates that a bus error occurs when reading the packet or payload or when writing status back to the packet payload. When an error is detected, the channel's processing will stop until the error is handled by software.
2 ERROR_SETUP	This bit indicates that the hardware detected an invalid programming configuration such as a buffer length that is not a multiple of the natural data size for the operation. When an error is detected, the channel's processing will stop until the error is handled by software.

Table continues on the next page...

Field	Description
31–16 RSVD	This field is reserved. Reserved, always set to zero.
15–0 RECOVERY_ TIMER	This field indicates the recovery time for the channel. After each operation, the recover timer for the channel is initialized with this value and then decremented until the timer reaches zero. The channel will not initiate operation on the next packet in the chain until the recovery time has been satisfied. The timebase for the recovery timer is 16 HCLK clock cycles, providing a range of 0ns to 8.3ms at 133 MHz operation.

### 18.4.24 DCP Channel 2 Command Pointer Address Register (DCP\_CH2CMDPTR)

The DCP channel 2 current command address register points to the multiword descriptor that is to be executed (or currently being executed). The channel may be activated by writing the command pointer address to a valid descriptor in memory and then updating the semaphore to a non-zero value. After the engine completes processing of a descriptor, the "next\_ptr" field from the descriptor is moved into this register to enable processing of the next descriptor. All channels with a non-zero semaphore value will arbitrate for access to the engine for the subsequent operation.

DCP Channel 2 is controlled by a variable sized command structure. This register points to the command structure to be executed.

EXAMPLE

```
DCP_CHn_CMDPTR_WR(2, v); // Write channel 2 command pointer
pCurptr = (DCP_chn_cmdptr_t *) DCP_CHn_CMDPTR_RD(2); // Read current command
pointer
```

Address: 20F\_C000h base + 180h offset = 20F\_C180h

DCP\_CH2CMDPTR field descriptions

Field	Description
31–0 ADDR	Pointer to descriptor structure to be processed for channel 2.

### 18.4.25 DCP Channel 2 Semaphore Register (DCP\_CH2SEMA)

The DCP Channel 2 semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state. After a command chain has been generated in memory, software should write the address of the first command descriptor to the CMDPTR register and then write a non-zero value to the semaphore register to indicate that the channel is active. Each command packet has a chaining bit which indicates that another descriptor should be loaded into the channel upon completion of the current descriptor. If the chaining bit is not set, the next address will not be loaded into the CMDPTR register. Each packet also contains a "decrement semaphore" bit, which indicates that the counting semaphore should be decremented after the operation. A channel is considered active when the semaphore is a non-zero value. When programming a series operations, software must properly program the semaphore values in conjunction with the "decrement\_semaphore" bits in the control packets to ensure that the proper number of descriptors are activated. A semaphore may be cleared by software by writing 0xFF to the DCP\_CHnSEMA\_CLR register. The logic will also clear the semaphore if an error has occurred.

Each DCP channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DCP chain processing. DCP processing continues until the engine attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DCP channel is stalled until software increments the semaphore count.

Address: 20F\_C000h base + 190h offset = 20F\_C190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**DCP\_CH2SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 VALUE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
7–0 INCREMENT	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DCP hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DCP channel decrements the count on the same clock, then the count is incremented by a net one. The semaphore may be cleared by writing 0xFF to the DCP_CHnSEMA_CLR register.

18.4.26 DCP Channel 2 Status Register (DCP\_CH2STAT)

The DCP Channel 2 Interrupt Status register contains the interrupt status bit and the tag of the last completed operation from the command chain. If an error occurs during processing, the ERROR bit is set and an interrupt is generated.

CH2STAT: 0x1A0

CH2STAT\_SET: 0x1A4

CH2STAT\_CLR: 0x1A8

CH2STAT\_TOG: 0x1AC

The interrupt status register is updated at the end of each work packet. If the interrupt bit is set in the command packet's command field, an interrupt will be generated once the packet has completed. In addition, the tag value from the command is stored in the TAG field so that software can identify which command structure was the last to complete. If an error occurs, the ERROR bit is set and processing of the command chain is halted.

Address: 20F\_C000h base + 1A0h offset = 20F\_C1A0h

DCP\_CH2STAT field descriptions

Field	Description
31–24 TAG	Indicates the tag from the last completed packet in the command structure
23–16 ERROR_CODE	Indicates additional error codes for some error conditions. 0x01 <b>NEXT_CHAIN_IS_0</b> — Error signalled because the next pointer is 0x00000000 0x02 <b>NO_CHAIN</b> — Error signalled because the semaphore is nonzero and neither chain bit is set 0x03 <b>CONTEXT_ERROR</b> — Error signalled because an error was reported reading/writing the context buffer 0x04 <b>PAYLOAD_ERROR</b> — Error signalled because an error was reported reading/writing the payload 0x05 <b>INVALID_MODE</b> — Error signalled because the control packet specifies an invalid mode select (for instance, blit + hash)
15–7 -	This field is reserved. Reserved, always set to zero.
6 ERROR_PAGEFAULT	This bit indicates a page fault occurred while converting a virtual address to a physical address.. When an error is detected, the channel's processing will stop until the error handled by software.
5 ERROR_DST	This bit indicates a bus error occurred when storing to the destination buffer. When an error is detected, the channel's processing will stop until the error handled by software.
4 ERROR_SRC	This bit indicates a bus error occurred when reading from the source buffer. When an error is detected, the channel's processing will stop until the error handled by software.
3 ERROR_PACKET	This bit indicates that a bus error occurred when reading the packet or payload or when writing status back to the packet payload. When an error is detected, the channel's processing will stop until the error is handled by software.
2 ERROR_SETUP	This bit indicates that the hardware detected an invalid programming configuration such as a buffer length that is not a multiple of the natural data size for the operation. When an error is detected, the channel's processing will stop until the error is handled by software.

Table continues on the next page...

**DCP\_CH2STAT field descriptions (continued)**

Field	Description
1 HASH_ MISMATCH	The bit indicates that a hashing check operation mismatched for control packets that enable the HASH_CHECK bit. When an error is detected, the channel's processing will stop until the error is handled by software.
0 RSVD_ COMPLETE	This field is reserved. This bit will always read 0 in the status register, but will be set to 1 in the packet status field after processing of the packet has completed. This was done so that software can verify that each packet completed properly in a chain of commands for cases when an interrupt is issued only for the last item in a packet. The completion bit for the channel is effectively the channel interrupt status bit.

**18.4.27 DCP Channel 2 Options Register (DCP\_CH2OPTS)**

The DCP Channel 2 Options Status register contains optional control information that may be used to further tune the behavior of the channel.

CH2OPTS: 0x1B0

CH2OPTS\_SET: 0x1B4

CH2OPTS\_CLR: 0x1B8

CH2OPTS\_TOG: 0x1BC

The options register can be used to control optional features of the channels.

Address: 20F\_C000h base + 1B0h offset = 20F\_C1B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**DCP\_CH2OPTS field descriptions**

Field	Description
31–16 RSVD	This field is reserved. Reserved, always set to zero.
15–0 RECOVERY_ TIMER	This field indicates the recovery time for the channel. After each operation, the recover timer for the channel is initialized with this value and then decremented until the timer reaches zero. The channel will not initiate operation on the next packet in the chain until the recovery time has been satisfied. The timebase for the recovery timer is 16 HCLK clock cycles, providing a range of 0ns to 8.3ms at 133 MHz operation.

### 18.4.28 DCP Channel 3 Command Pointer Address Register (DCP\_CH3CMDPTR)

The DCP channel 3 current command address register points to the multiword descriptor that is to be executed (or currently being executed). The channel may be activated by writing the command pointer address to a valid descriptor in memory and then updating the semaphore to a non-zero value. After the engine completes processing of a descriptor, the "next\_ptr" field from the descriptor is moved into this register to enable processing of the next descriptor. All channels with a non-zero semaphore value will arbitrate for access to the engine for the subsequent operation.

DCP Channel 3 is controlled by a variable sized command structure. This register points to the command structure to be executed.

#### EXAMPLE

```

DCP_CHn_CMDPTR_WR(3, v); // Write channel 3 command pointer
pCurptr = (DCP_chn_cmdptr_t *) DCP_CHn_CMDPTR_RD(3); // Read current command
pointer

```

Address: 20F\_C000h base + 1C0h offset = 20F\_C1C0h

DCP\_CH3CMDPTR field descriptions

Field	Description
31–0 ADDR	Pointer to descriptor structure to be processed for channel 3.

## 18.4.29 DCP Channel 3 Semaphore Register (DCP\_CH3SEMA)

The DCP Channel 3 semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state. After a command chain has been generated in memory, software should write the address of the first command descriptor to the CMDPTR register and then write a non-zero value to the semaphore register to indicate that the channel is active. Each command packet has a chaining bit which indicates that another descriptor should be loaded into the channel upon completion of the current descriptor. If the chaining bit is not set, the next address will not be loaded into the CMDPTR register. Each packet also contains a "decrement semaphore" bit, which indicates that the counting semaphore should be decremented after the operation. A channel is considered active when the semaphore is a non-zero value. When programming a series operations, software must properly program the semaphore values in conjunction with the "decrement\_semaphore" bits in the control packets to ensure that the proper number of descriptors are activated. A semaphore may be cleared by software by writing 0xFF to the DCP\_CHnSEMA\_CLR register. The logic will also clear the semaphore if an error has occurred.

Each DCP channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DCP chain processing. DCP processing continues until the engine attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DCP channel is stalled until software increments the semaphore count.

Address: 20F\_C000h base + 1D0h offset = 20F\_C1D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								VALUE								Reserved								INCREMENT							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**DCP\_CH3SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 VALUE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
7–0 INCREMENT	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DCP hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DCP channel decrements the count on the same clock, then the count is incremented by a net one. The semaphore may be cleared by writing 0xFF to the DCP_CHnSEMA_CLR register.

### 18.4.30 DCP Channel 3 Status Register (DCP\_CH3STAT)

The DCP Channel 3 Interrupt Status register contains the interrupt status bit and the tag of the last completed operation from the command chain. If an error occurs during processing, the ERROR bit is set and an interrupt is generated.

DCP\_CH3STAT: 0x1E0

CH3STAT\_SET: 0x1E4

CH3STAT\_CLR: 0x1E8

CH3STAT\_TOG: 0x1EC

The interrupt status register is updated at the end of each work packet. If the interrupt bit is set in the command packet's command field, an interrupt will be generated once the packet has completed. In addition, the tag value from the command is stored in the TAG field so that software can identify which command structure was the last to complete. If an error occurs, the ERROR bit is set and processing of the command chain is halted.

Address: 20F\_C000h base + 1E0h offset = 20F\_C1E0h

## DCP Memory Map/Register Definition

**DCP\_CH3STAT field descriptions**

Field	Description
31–24 TAG	Indicates the tag from the last completed packet in the command structure
23–16 ERROR_CODE	Indicates additional error codes for some error conditions. 0x01 <b>NEXT_CHAIN_IS_0</b> — Error signalled because the next pointer is 0x00000000 0x02 <b>NO_CHAIN</b> — Error signalled because the semaphore is nonzero and neither chain bit is set 0x03 <b>CONTEXT_ERROR</b> — Error signalled because an error was reported reading/writing the context buffer 0x04 <b>PAYLOAD_ERROR</b> — Error signalled because an error was reported reading/writing the payload 0x05 <b>INVALID_MODE</b> — Error signalled because the control packet specifies an invalid mode select (for instance, blit + hash)
15–7 -	This field is reserved. Reserved, always set to zero.
6 ERROR_PAGEFAULT	This bit indicates a page fault occurred while converting a virtual address to a physical address.. When an error is detected, the channel's processing will stop until the error handled by software.
5 ERROR_DST	This bit indicates a bus error occurred when storing to the destination buffer. When an error is detected, the channel's processing will stop until the error handled by software.
4 ERROR_SRC	This bit indicates a bus error occurred when reading from the source buffer. When an error is detected, the channel's processing will stop until the error handled by software.
3 ERROR_PACKET	This bit indicates that a bus error occurred when reading the packet or payload or when writing status back to the packet payload. When an error is detected, the channel's processing will stop until the error is handled by software.
2 ERROR_SETUP	This bit indicates that the hardware detected an invalid programming configuration such as a buffer length that is not a multiple of the natural data size for the operation. When an error is detected, the channel's processing will stop until the error is handled by software.

*Table continues on the next page...*

**DCP\_CH3STAT field descriptions (continued)**

Field	Description
1 HASH_ MISMATCH	The bit indicates that a hashing check operation mismatched for control packets that enable the HASH_CHECK bit. When an error is detected, the channel's processing will stop until the error is handled by software.
0 RSVD_ COMPLETE	This field is reserved. This bit will always read 0 in the status register, but will be set to 1 in the packet status field after processing of the packet has completed. This was done so that software can verify that each packet completed properly in a chain of commands for cases when an interrupt is issued only for the last item in a packet. The completion bit for the channel is effectively the channel interrupt status bit.

**18.4.31 DCP Channel 3 Options Register (DCP\_CH3OPTS)**

The DCP Channel 3 Options Status register contains optional control information that may be used to further tune the behavior of the channel.

DCP\_CH3OPTS: 0x1F0

CH3OPTS\_SET: 0x1F4

CH3OPTS\_CLR: 0x1F8

CH3OPTS\_TOG: 0x1FC

The options register can be used to control optional features of the channels.

Address: 20F\_C000h base + 1F0h offset = 20F\_C1F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**DCP\_CH3OPTS field descriptions**

Field	Description
31–16 RSVD	This field is reserved. Reserved, always set to zero.
15–0 RECOVERY_ TIMER	This field indicates the recovery time for the channel. After each operation, the recover timer for the channel is initialized with this value and then decremented until the timer reaches zero. The channel will not initiate operation on the next packet in the chain until the recovery time has been satisfied. The timebase for the recovery timer is 16 HCLK clock cycles, providing a range of 0ns to 8.3ms at 133 MHz operation.

**18.4.32 DCP Debug Select Register (DCP\_DBGSELECT)**

This register selects a debug register to view.

This register selects debug information to return in the debug data register.

Address: 20F\_C000h base + 400h offset = 20F\_C400h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### DCP\_DBGDATA field descriptions

Field	Description
31–0 DATA	Debug Data

### 18.4.34 DCP Page Table Register (DCP\_PAGETABLE)

The DCP Page Table register controls the virtual memory functionality of the DCP. It provides a base address for the page table as well as an enable/disable bit and the ability to flush the cached page table entries.

This register returns the debug data from the selected debug index source.

Address: 20F\_C000h base + 420h offset = 20F\_C420h

DCP\_PAGETABLE field descriptions

Field	Description
31–2 BASE	Page Table Base Address. The page table must be word aligned and the pointer should reference a page table in the standard ARM format.
1 FLUSH	Page Table Flush control. To flush the TLB, write this bit to a 1 then back to a 0.
0 ENABLE	Page Table Enable control. Virtual addressing will only be used when this bit is set to a 1. Disabling the page table will not flush any cached entries, so software should write the FLUSH high and enable LOW when updating page tables.

18.4.35 DCP Version Register (DCP\_VERSION)

Read-only register indicating implemented version of the DCP.

This register returns the debug data from the selected debug index source.

Address: 20F\_C000h base + 430h offset = 20F\_C430h

DCP\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR version of the design implementation.

Table continues on the next page...

**DCP\_VERSION field descriptions (continued)**

Field	Description
23–16 MINOR	Fixed read-only value reflecting the MINOR version of the design implementation.
15–0 STEP	Fixed read-only value reflecting the stepping of version of the design implementation.

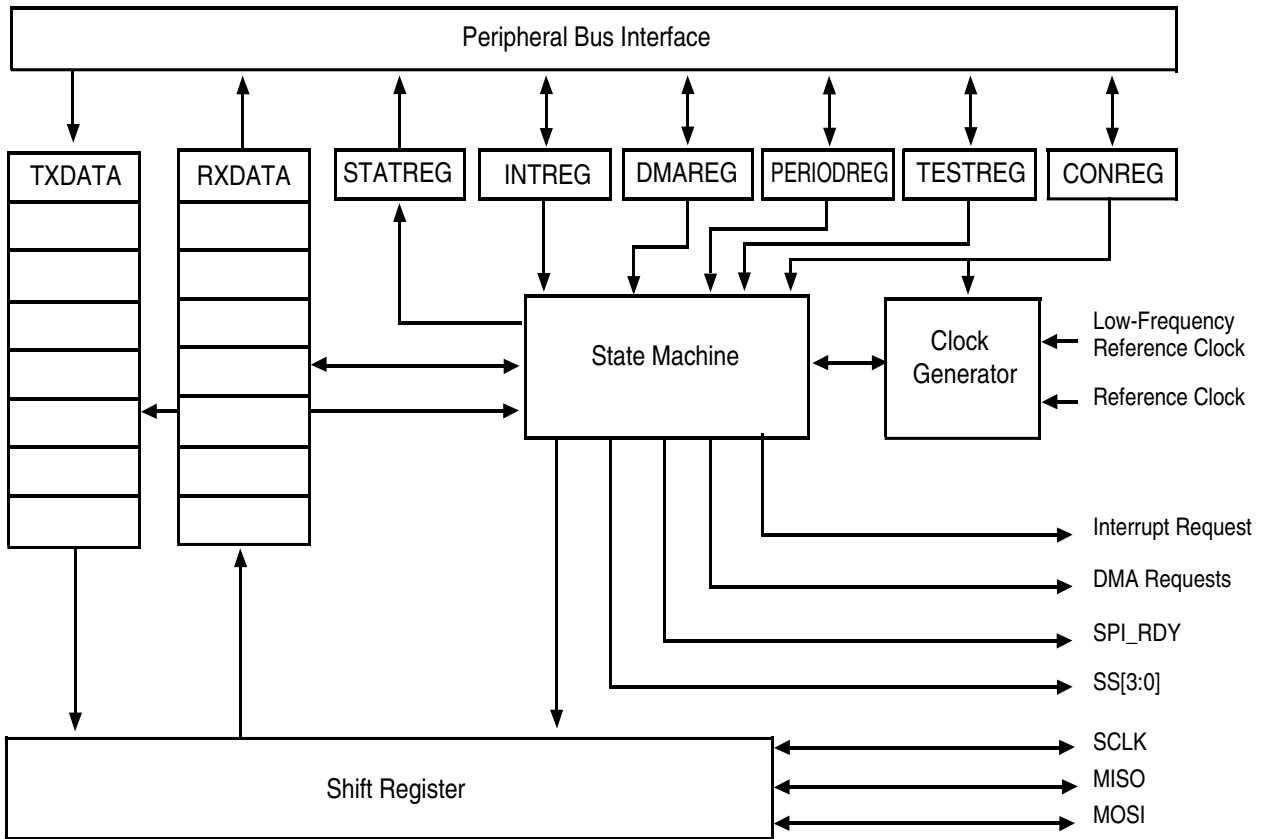

## Chapter 19

# Enhanced Configurable SPI (ECSPI)

### 19.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

**Figure 19-1. ECSPI Block Diagram**

### 19.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

## 19.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- [Master Mode](#)
- [Slave Mode](#)
- [Low Power Modes](#)

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- [Typical Master Mode](#)
  - [Master Mode with SPI\\_RDY](#)
  - [Master Mode with Wait States](#)
  - [Master Mode with SS\\_CTL\[3:0\] Control](#)
  - [Master Mode with Phase Control](#)
- [Typical Slave Mode](#)

## 19.2 External Signals

The following table describes the external signals of ECSPI:

**Table 19-1. ECSPI1 External Signals**

Signal	Description	Pad	Mode	Direction
ECSPI1_MISO (MISO)	Master data in; slave data out	ECSPI1_MISO	ALT0	IO
		LCD_DAT1	ALT1	
ECSPI1_MOSI (MOSI)	Master data out; slave data in	ECSPI1_MOSI	ALT0	IO
		LCD_DAT0	ALT1	
ECSPI1_RDY (RDY)	SPI data ready signal	I2C2_SCL	ALT6	I
		LCD_DAT7	ALT1	
ECSPI1_SCLK (SCLK)	SPI clock signal	ECSPI1_SCLK	ALT0	IO
		LCD_DAT3	ALT1	
ECSPI1_SS0 (SS0)	Chip select signal	ECSPI1_SS0	ALT0	IO
		LCD_DAT2	ALT1	
ECSPI1_SS1 (SS1)	Chip select signal	I2C1_SCL	ALT6	IO
		LCD_DAT4	ALT1	
ECSPI1_SS2 (SS2)	Chip select signal	I2C1_SDA	ALT6	IO
		LCD_DAT5	ALT1	
ECSPI1_SS3 (SS3)	Chip select signal	ECSPI2_SS0	ALT1	IO
		LCD_DAT6	ALT1	

**Table 19-2. ECSPi2 External Signals**

Signal	Description	Pad	Mode	Direction
ECSPi2_MISO (MISO)	Master data in; slave data out	ECSPi2_MISO	ALT0	IO
		EPDC_SDLE	ALT1	
		LCD_DAT10	ALT4

		FEC_TXD0	ALT3	
ECSPI4_SS3 (SS3)	Chip select signal	EPDC_D6	ALT1	IO

Figure 19-2 shows the ECSPI in master mode connected to four external devices in a one-way communication link.

Figure 19-2. Example Connection Diagram

19.3 Clocks

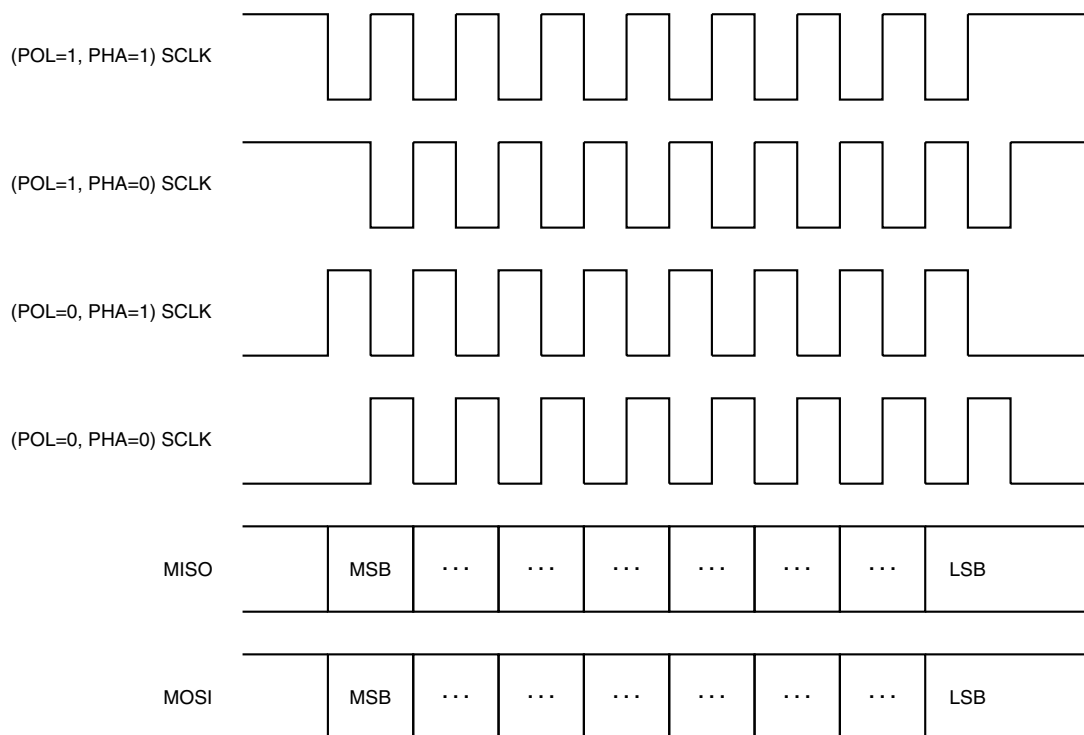

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 19-5. eCSPI Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 19.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

**Figure 19-3. ECSPI SCLK, MISO, and MOSI Relationship**

### 19.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI\_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

## 19.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select ( $\overline{SS}$ ) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when SSCTL (SSB\_CTRL[x] bit) is cleared. The accurate burst length should always be specified using the BURST\_LENGTH parameter. SSCTL (SSB\_CTRL[x] bit) set to 1 is not supported in slave mode.

## 19.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

## 19.4.4 Operations

The information found here describes the ECSPI's operations.

### 19.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI\_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI\_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

**Figure 19-4. Typical SPI Burst (8-bit Transfer)**

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

#### 19.4.4.1.1 Master Mode with SPI\_RDY

By default, the ECSPI does not use the SPI\_RDY signal in master mode (MODE = 1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI\_CONREG[XCH] bit or the ECSPI\_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI\_CONREG[DRCTL]) bits contains either 01 or 10, the SPI\_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI\_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI\_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI\_RDY signal.

**Figure 19-5. Relationship Between a SPI Burst and SPI\_RDY: Falling-Edge Triggered**

A SPI burst does not start until the falling edge of the SPI\_RDY signal is detected. The next SPI burst starts when the next SPI\_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI\_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI\_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI\_RDY signal. The SPI burst does not begin until the SPI\_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI\_RDY signal remains low.

**Figure 19-6. Relationship Between a SPI Burst and SPI\_RDY: Low-Level Triggered**

#### 19.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

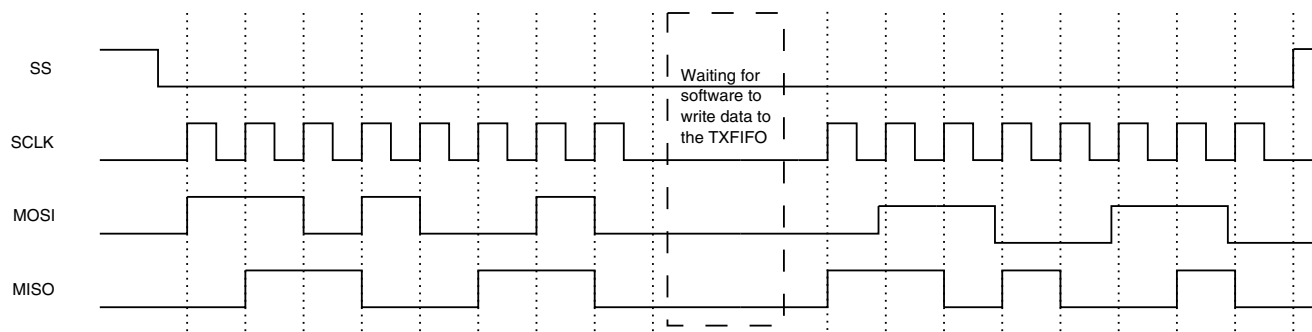

**Figure 19-7. SPI Bursts with Wait States**

In this case, the number of wait states is controlled by ECSPI\_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI\_PERIODREG[CSRC].

#### 19.4.4.1.3 Master Mode with SS\_CTL[3:0] Control

The SPI SS Control (SS\_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS\_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS\_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI\_CONREG register.

**Figure 19-8. SPI Burst While SS\_CTL[3:0] is Clear**

In [Figure 19-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI\_CONREG control register. ([Figure 19-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

**Figure 19-9. SPI Bursts While SS\_CTL[3:0] is Set**

In [Figure 19-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

#### 19.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI\_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI\_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI\_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 19-10](#) shows how SPI burst works with different POL and PHA configuration.

**Figure 19-10. SPI Burst with Different POL and PHA Configurations**

#### 19.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration,  $\overline{SS}$  becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS\_CTL[3:0] is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SSPOL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

**Figure 19-11. Advancing the Data FIFO on the Rising Edge of  $\overline{SS}$**

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

### 19.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

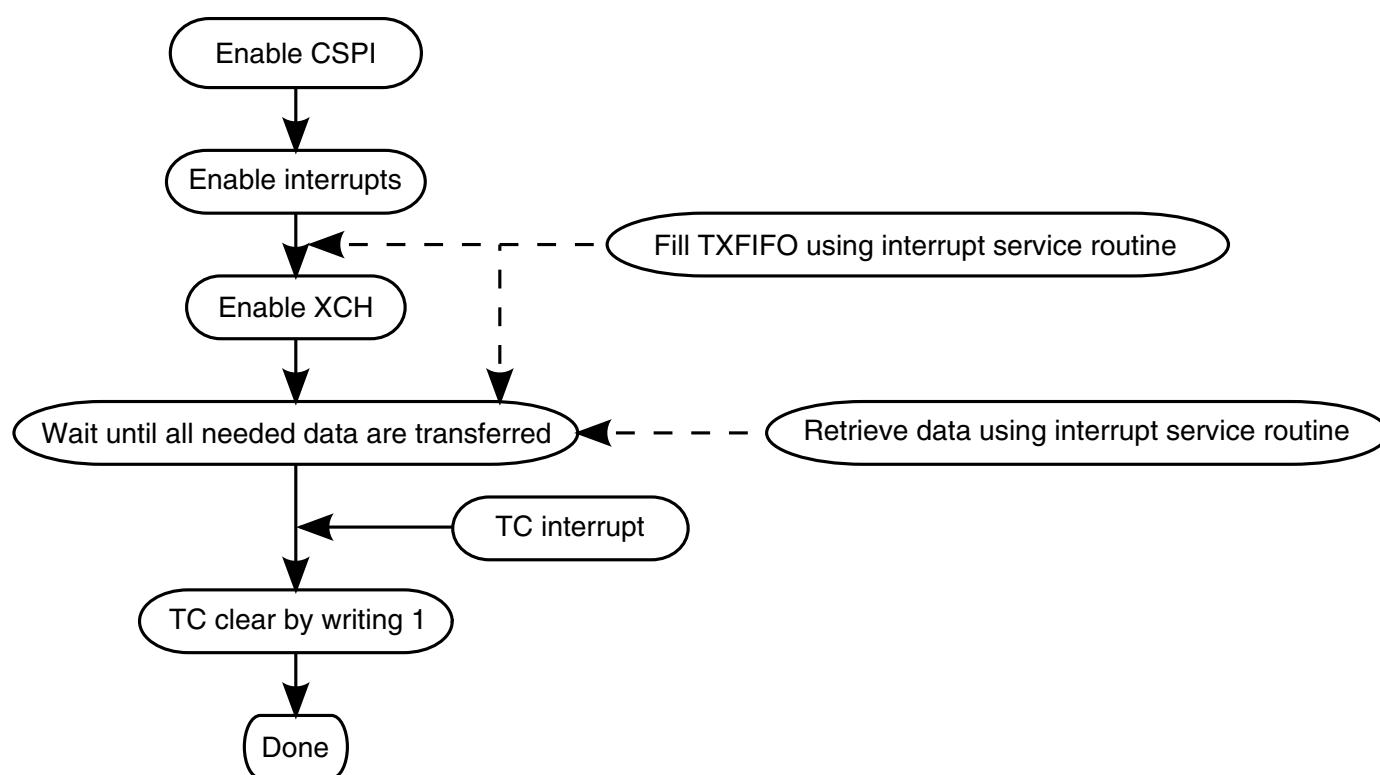

### 19.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

**Figure 19-12. Program Sequence of SPI Burst Using Interrupt Control**

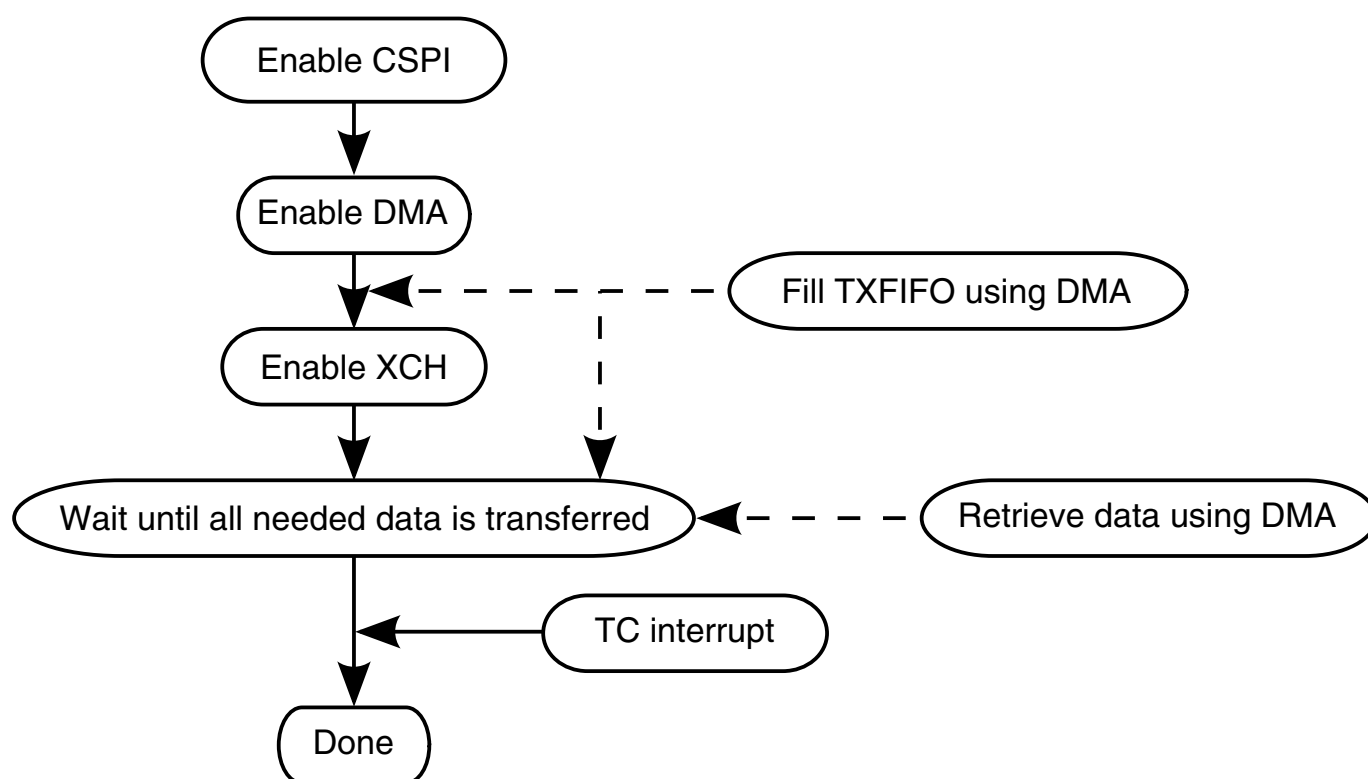

## 19.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

**Figure 19-13. Program Sequence of SPI Burst Using DMA**

## 19.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

## 19.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI\_CONREG to reset the block.
2. Enable the clocks for ECSPI.
3. Set the EN bit in ECSPI\_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

## 19.6 Applications

Figure 19-14. Flowchart of the ECSPI Operation

## 19.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

## ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
200_8000	Receive Data Register (ECSPI1_RXDATA)	32	R	0000_0000h	<a href="#">19.7.1/744</a>

## 19.7.2 Receive Data Register (ECSPiX\_RXDATA)

The Receive Data register (ECSPI\_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## ECSPiX\_RXDATA field descriptions

Field	Description
31–0 ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

### 19.7.3 Transmit Data Register (ECSPIx\_TXDATA)

The Transmit Data (ECSPI\_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI\_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI\_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### ECSPIx\_TXDATA field descriptions

Field	Description
31–0 ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BIT_COUNT field of the corresponding SPI Control register. If this field contains more bits than the number specified by BIT_COUNT, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

### 19.7.4 Control Register (ECSPIx\_CONREG)

The Control Register (ECSPI\_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI\_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## ECSPiX\_CONREG field descriptions

Field	Description
31–20 BURST_LENGTH	<p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of <math>2^{12}</math> bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the <math>n</math> least-significant (<math>n = \text{BURST\_LENGTH} + 1</math>) will be shifted out. The remaining bits will be ignored.</p> <p>In slave mode, only when SS_CTL is cleared, this field will take effect in the transfer.</p> <p>Number of Valid Bits in a SPI burst.</p> <p>0x000 A SPI burst contains the 1 LSB in a word.  0x001 A SPI burst contains the 2 LSB in a word.  0x002 A SPI burst contains the 3 LSB in a word.  ...  0x01F A SPI burst contains all 32 bits in a word.  0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word.  0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word.  ...  0xFFE A SPI burst contains the 31 LSB in first word and <math>2^7 - 1</math> words.  0xFFF A SPI burst contains <math>2^7</math> words.</p>
19–18 CHANNEL_SELECT	<p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SS<sub>n</sub>) outputs. Only the selected Chip Select (SS<sub>n</sub>) signal can be active at a given time; the remaining three signals will be negated.</p> <p>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted.  01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted.  10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted.  11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</p>
17–16 DRCTL	<p>SPI Data Ready Control. This field selects the utilization of the <math>\overline{\text{SPI\_RDY}}</math> signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <p>00 The <math>\overline{\text{SPI\_RDY}}</math> signal is a don't care.  01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered).  10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered).  11 Reserved.</p>
15–12 PRE_DIVIDER	<p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock.</p> <p>0000 Divide by 1.  0001 Divide by 2.  0010 Divide by 3.  ...  1101 Divide by 14.  1110 Divide by 15.  1111 Divide by 16.</p>
11–8 POST_DIVIDER	<p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: <math>2^n</math>.</p> <p>0000 Divide by 1.</p>

Table continues on the next page...

**ECSPiX\_CONREG field descriptions (continued)**

Field	Description
	0001 Divide by 2. 0010 Divide by 4. ... 1110 Divide by $2^{14}$ . 1111 Divide by $2^{15}$ .
7–4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0.  0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to.  0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out.  0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product.  0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPiX_CONREG. The block's internal clocks are gated off whenever the block is disabled.  0 Disable the block. 1 Enable the block.

## 19.7.5 Config Register (ECSPIx\_CONFIGREG)

The Config Register (ECSPI\_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
R	Reserved								HT_LENGTH				SCLK_CTL				DATA_CTL				SS_POL				SS_CTL				SCLK_POL				SCLK_PHA			
W	Reserved								HT_LENGTH				SCLK_CTL				DATA_CTL				SS_POL				SS_CTL				SCLK_POL				SCLK_PHA			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0				

### ECSPIx\_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0.  0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0.  0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

*Table continues on the next page...*

**ECSPiX\_CONFIGREG field descriptions (continued)**

Field	Description
	<p>0 Active low. 1 Active high.</p>
11–8 SS_CTL	<p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS_CTL[3] is for SPI channel 3. SS_CTL[2] is for SPI channel 2. SS_CTL[1] is for SPI channel 1. SS_CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty.</p> <p>0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid. 1 In slave mode - an SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p>
7–4 SCLK_POL	<p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See <a href="#">Figure 19-10</a> for more information.</p> <p>SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).</p>
3–0 SCLK_PHA	<p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See <a href="#">Figure 19-10</a> for more information.</p> <p>SCLK_PHA[3] is for SPI channel 3. SCLK_PHA[2] is for SPI channel 2. SCLK_PHA[1] is for SPI channel 1. SCLK_PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation. 1 Phase 1 operation.</p>

## 19.7.6 Interrupt Control Register (ECSPIx\_INTREG)

The Interrupt Control Register (ECSPI\_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved

**ECSPIx\_INTREG field descriptions**

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

*Table continues on the next page...*

**ECSPIx\_INTREG field descriptions (continued)**

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

**19.7.7 DMA Control Register (ECSPIx\_DMAREG)**

The Direct Memory Access Control Register (ECSPI\_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**ECSPiX\_DMAREG field descriptions**

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request is generated even if it is less than or equal to RX_THRESHOLD.  0   Disable 1   Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request.  0   Disable 1   Enable
22 -	This field is reserved. Reserved
21–16 RX_THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request.  0   Disable 1   Enable
6 -	This field is reserved. Reserved
5–0 TX_THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is greater than TX_THRESHOLD.

## 19.7.8 Status Register (ECSPIx\_STATREG)

The ECSPI Status Register (ECSPI\_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000\_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	Reserved								TC	RO	RF	RDR	RR	TF	TDR	TE
W									w1c	w1c						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

**ECSPIx\_STATREG field descriptions**

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it.  0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it.  0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full.  0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request.  0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO.  0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

*Table continues on the next page...*

**ECSPiX\_STATREG field descriptions (continued)**

Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request.  0 Number of empty slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of empty slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty.  0 TXFIFO contains one or more words. 1 TXFIFO is empty.

**19.7.9 Sample Period Control Register (ECSPiX\_PERIODREG)**

The Sample Period Control Register (ECSPiX\_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPiX\_CONREG[CHANNEL MODE] = 1). ECSPiX\_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table continues on the next page...

**ECSPiX\_PERIODREG field descriptions (continued)**

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter.  0    SPI Clock (SCLK) 1    Low-Frequency Reference Clock (32.768 KHz)
14–0 SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPiX_CONREG register.  0x0000    0 wait states inserted 0x0001    1 wait state inserted ...        ... 0x7FFE    32766 wait states inserted 0x7FFF    32767 wait states inserted

19.7.10 Test Control Register (ECSPIdx\_TESTREG)

The Test Control Register (ECSPI\_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPIdx\_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored.  0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

Table continues on the next page...

**ECSPiX\_TESTREG field descriptions (continued)**

Field	Description
7 -	This field is reserved. Reserved
6–0 TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

**19.7.11 Message Data Register (ECSPiX\_MSGDATA)**

The Message Data Register (ECSPiX\_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	ECSPiX_MSGDATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ECSPiX\_MSGDATA field descriptions**

Field	Description
31–0 ECSPiX_MSGDATA	ECSPiX_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

## **Chapter 20**

# **External Interface Module (EIM)**

### **20.1 Overview**

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

## Overview

Figure 20-1. EIM Diagram

## 20.1.1 Features

- Up to six chip selects for external devices
  - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see [Chip Select Memory Map](#)). Configurable Chip Select 0 base address (by VIA)
  - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
  - 26-bit external address bus, max memory size can be 128 MByte (1 Gigabit).
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 and x32 port size
- Programmable Data Port Size for each Chip Select (x8, x16 and x32)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 and x32 port size)
- Support continuous Burst Clock which can be used as reference clock for FPGA
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- ARM AXI slave interface. One ID at a time support.
- External Interrupt support, RDY\_INT signal function as external interrupt
- Boot from external device support according to boot signals, using RDY\_INT signal
  - RDY signal support assertion after reset for MDOC™ (M-Systems) device
  - INT signal support assertion after reset for OneNAND™ (Samsung) device

## 20.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode

- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the [EIM Operational Modes](#).

### 20.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

### 20.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

### 20.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16/ x32 data width memory devices.

For more information about the pins that drive data/address in 8/16/32 non-muxed mode and 16/32 muxed mode, refer to the EIM Internal Module Multiplexing table in the EIM Internal Pads Allocation chapter of the datasheet.

**Table 20-1. EIM multiplexing**

Setup	Non Multiplexed Address/Data Mode							Multiplexed Address/ Data mode	
	8 Bit				16 Bit		32 Bit	16 Bit	32 Bit
	MUM = 0, DSZ = 100	MUM = 0, DSZ = 101	MUM = 0, DSZ = 110	MUM = 0, DSZ = 111	MUM = 0, DSZ = 001	MUM = 0, DSZ = 010	MUM = 0, DSZ = 011	MUM = 1, DSZ = 001	MUM = 1, DSZ = 011

#### 20.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT\_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT\_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

#### NOTE

Maximum frequency of the EIM main clock is 133Mhz. It may be reduced by the system for special cases of external devices,

which demand a different frequency than integer division of the 133MHz clock.

### 20.1.2.5 Low Power Modes

The input clock is gated by ACT\_CS bits. When all the ACT\_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

### 20.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See for more details.

## 20.2 External Signals

The following table describes the external signals of EIM:

**Table 20-2. EIM External Signals**

Signal	Description	Pad	Mode	Direction
EIM_ACLK_FREERUN	AXI clock signal	EPDC_PWRINT	ALT3	I
EIM_AD00	LSB multiplexed Address/Data Bus signal	KEY_COL0	ALT3	IO

*Table continues on the next page...*

**Table 20-2. EIM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
EIM_EB3	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.  EIM_EB[3] corresponds to DATA_OUT[31:24].  For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	LCD_DAT22	ALT3	O
EIM_LBA	Address Valid. This active-low output signal is asserted during burst mode accesses to cause the external burst capable device to load a new starting burst address. Assertion of LBA indicates that a valid address is present on the address bus. Its behavior is affected by the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1 registers, the RADVA and RADVN fields of the EIM_CSxRCR1 registers, and the WADVA and WADVN fields of the EIM_CSxWCR1 registers. In asynchronous mode, LBA length is affected by the RADVA, WADVA, RADVN, and WADVN fields. Minimum length of LBA signal in all modes is one EIM clock cycle.	EPDC_SDCE1	ALT3	O
EIM_OE	Output Enable. This active-low output signal indicates the bus access is a read and enables external devices to drive the data bus with read data. Its behavior is affected by the OEA and OEN bit fields in the Chip Select Configuration Registers.	EPDC_PWRCTRL1	ALT3	O
		LCD_ENABLE	ALT3	
EIM_RW	Memory Write Enable. This active-low output signal indicates the bus access is a write and enables external devices to sample the data bus. Its behavior is affected by the WEA and WEN bit fields in the Chip Select Configuration Registers.	EPDC_PWRCTRL0	ALT3	O
		LCD_CLK	ALT3	

*Table continues on the next page...*

**Table 20-2. EIM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
EIM_WAIT	Ready/Busy/Wait signal. This active-low input signal is asserted by external burst capable devices which support fixed or variable latency of data. It is serviced in synchronous mode only (EIM_CSxGCR1[SWR, SRD] =1). WAIT will have a pull up resistor in I/O. The signal indicates whether the External device is ready for data transaction or not. Busy cycles (or wait cycles) of the external device can occur at the start of a Burst access or at page boundary crossover.  <b>NOTE:</b> For burst devices, WAIT output should be configured to change one cycle before data is ready (before delay).  <b>NOTE:</b> Some External devices may not use this input signal for ready state indication (fix latency without WAIT signal monitoring). For these devices EIM should be configured accordingly (see RFL, WFL, and PSZ field descriptions).  <b>NOTE:</b> This is same as what is shown in IP_IND_WAIT_B	EPDC_PWRSTAT	ALT3	I
		LCD_RESET	ALT3	

### 20.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals which are internal to the that are important to understand the function of EIM.

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM. See Table 5-4 for detailed description.
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

## 20.3 Clocks

The following table describes the clock sources for EIM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 20-4. EIM Clocks**

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- **ACLK:** EIM clock (main clock, AXI clock) with a Max frequency of 133Mhz. Can be gated externally when there is no active AXI access.
- **ACLK\_SLOW:** EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- **IPG\_CLK\_S:** IPG clock for IP accesses. IP registers are activated by ACLK\_SLOW clock.
- **ACLK\_EXSC:** Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

## 20.4 Chip Select Memory Map

**Table 20-5. EIM Chip Select Memory Map**

Address	Space Size	Use	Access
EIM_NFC_BASE/ACT_CS/ADDRS0 inputs	128MB	CS0 memory region	R/W
ACT_CS/ADDRS1 inputs	128MB	CS1 memory region	R/W
ACT_CS/ADDRS2 inputs	128MB	CS2 memory region	R/W
ACT_CS/ADDRS3 inputs	128MB	CS3 memory region	R/W

## 20.5 Functional Description

This section provides the functional description for the EIM.

### 20.5.1 Continuous BCLK

EIM module can be programmed to provide a continuous BCLK in synchronous mode as the reference clock of PPGA. In this case, an internal DLL(Delay-locked Loop) is used to synchronize the internal clock which is used to sample read data from the I/O pad, with the feedback BCLK from PAD. The DLL compares the phase difference of internal clock to the feedback BCLK and will lock up when the delay of Reference Delay Line equals to the phase difference. After the lock up of Reference Delay Chain , DLL will copy the Master Delay Chain's value to Slave Delay Chain automatically. The Slave Delay Chain is used to delay the internal clock. If continuous BCLK is not selected, DLL should not be enabled.

When using an continuous BCLK in synchronous mode, BCD MUST be set to 0, otherwise will cause malfunction of EIM.

To let EIM work properly under continuous BCLK MODE, the initialization must follow below procedure. The initialize procedure should be done before any access to EIM. If it is not possible to do so, e.g. device booted up from EIM, the initialize flow should be done after performing a reset of EIM.

The recommended initialize flow is as follow

1. Disable EIM clock by clearing bit 4 of EIM\_WIAR Register.
2. Select Continuous BCLK by setting bit 3 of EIM\_WCR Register.
3. Enable DLL by setting bit 0 of EIM\_DCR Register.
4. Enable EIM clock by setting bit 4 of EIM\_WIAR Register.
5. Reset DLL by toggling bit 1 of EIM\_DCR Register(1->0->1).
6. Wait for DLL lock (Both bit 0 and bit 1 of EIM\_DSR Register are asserted).

After initialization, EIM can be programed to various access timing, but BCD MUST be kept to 0.

DLL Upadte Interval and inital value can be set by write EIM\_DCR Register in corresponding bit field.

Also DLL provides manual adjustment to delay. An extra offset can be added to internal delay line, which can be used when DLL have some kind of predicable error. OVERRIDE bit field of EIM\_DCR register will override reference DLL locked value and use a direct value for delay.

Note: During initialization, BCLK frequency and duty cycle are not guaranteed.

## 20.5.2 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA\_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA\_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

### NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

### 20.5.2.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

#### 20.5.2.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (ARM platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

### 20.5.2.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

## 20.5.3 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

**Table 20-6. EIM Operation Modes Field Settings**

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
	1	0	0
1			Synchronous write/ Asynchronous read multiplexed
1		0	Asynchronous write/Synchronous read multiplexed
		1	Synchronous write/read multiplexed

## 20.5.4 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts  $\overline{ADV}$ , causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

### **NOTE**

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

## **20.5.5 Burst Clock Divisor (BCD)**

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected;  $\overline{ADV}$  and BCLK. The  $\overline{ADV}$  signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

### 20.5.6 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=1](#) and [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=0](#) for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

### 20.5.7 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

### 20.5.8 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional  $\overline{ADV}$  signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating  $\overline{ADV}$  signal.

## 20.5.9 AXI (Master) Bus Cycles Support

The EIM uses an ARM AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

### NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.

- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case ARM cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See [Table 20-8](#).

**Table 20-7. AXI Burst Cycles Supported**

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

**Table 20-8. AXI to Memory Burst Splits Number**

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8 Memory Port size	# of accesses to X16 Memory Port size	# of accesses to X32 Memory Port size
INC16 Aligned Addr.	WRAP4	16	8	4
	Cont.	1	1	1

	Cont.	1	1	1
WRAP8 Unaligned Addr.	WRAP16	2 or 3	1	2
	Cont.	2	2	2

### 20.5.10 WAIT\_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

### 20.5.11 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

### 20.5.12 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

### 20.5.13 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the wdog\_limit (according to the WDOG\_LIMIT bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In dtack access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the wdog\_limit before the device asserts the dtack signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can be disabled by WDOG\_EN bit in the WCR.

### 20.5.14 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
  - Access to a disabled chip select - access to a mapped chip select address space where the CSEN bit in the corresponding chip select Configuration Register is clear

- Access to a non mapped address - access to an address that is not mapped to any CS.
- User access to a supervisor-protected chip select address space (the SP bit in the corresponding chip select Configuration Register is set)
- User access in fixed mode access
- User performs write access to write protected chip select
- First write data ID and write address ID do not match. (No data is written to the memory.)
- First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
- Access duration to external device from CSx signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled by software.
- IPS errors
  - User read or write access to a reserved/non-valid address in the EIM Configuration Register

## 20.5.15 DTACK Mode

In DTACK mode, the EIM uses DTACK signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see [Figure 20-15](#), [Figure 20-16](#) & [Figure 20-17](#)).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see [Figure 20-19](#)).

## 20.5.16 RDY\_INT Signal as Interrupt

The EIM has an external interrupt support. When INTEN bit in the WCR is set, signal RDY\_INT is used as interrupt; its status is being reflected by INT bit and output signal.

It is cleared by writing one to the INT bit. When INTEN is cleared, the interrupt is disabled. This interrupt is a level interrupt and its polarity can be configured by the INTPOL bit in the WCR.

### 20.5.17 RDY\_INT Signal as Ready After Reset Indication

This feature is used for boot propose from external devices based on NANDFlash array memory with NORFlash interface.

When ERRST bit is set, RDY\_INT signal is monitored to determine ready after reset of the external device located on CS0.

The monitoring is taking place when CS0 is accessed for the first time. The access will be pending until assertion of the signal is detected. When detection occurs, ERRST bit is self-cleared and pending access is executed to the external device on CS0.

### 20.5.18 EIM\_GRANT / EIM\_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM\_BUSY signal (1'b1) and checks the EIM\_GRANT signal status.

If EIM\_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM\_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM\_BUSY signal set until it completes the access toward the external device.

Once EIM\_GRANT signal is set, it can not be reset until EIM\_BUSY signal is cleared by EIM.

#### NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM\_GRANT signal from NFC and doesn't assert the EIM\_BUSY signal.

## 20.5.19 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

## 20.5.20 Endianness

Big and Little endianness are supported by the controller according to the following table.

**Table 20-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0**

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port			Byte port	
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2

		3	0xB3					0xB3		3	0xB3

## 20.5.21 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

### NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

## 20.6 Initialization Information

## 20.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM\_BOOT [2:0] block inputs.

## 20.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR\_I(address, data, delta, counter) is a write data sequence, there  $\text{data}(i+1) = \text{data}(i) + \text{delta}$
- COMMAND\_SEQUENCE
- CHECK\_STATUS

### NOTE

COMMAND\_SEQUENCE and CHECK\_STATUS are described in [AMD Flash Utility](#), [Intel Sibley Flash Utility](#), [MDOC Device Utility](#), [Samsung OneNAND Utility](#), and [Spansion Flash Utility](#).

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM\_" is a prefix of EIM's registers. 'h' is a prefix of hexadecimal constant. "///" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verified with the memory models listed below and may require some adjustments for other family members.

### 20.7.1 Access to AMD Flash

The following mentioned configurations are intended for AMD Simultaneous Flash Memory w/ VersatileIO™ Control.

### 20.7.1.1 AMD Flash Asynchronous Mode Configuration

EIM register configuration used for AMD flash asynchronous access:

- WR32('EIM\_CS0RCR1,'h0a018000);
- WR32('EIM\_CS0WCR1,'h0704a240);
- WR32('EIM\_CS0GCR1,'h00430081); // for 32 bit memory
- WR32('EIM\_CS0GCR1,'h00410081); // for 16 bit memory

### 20.7.1.2 AMD Flash Utility

```
// Single data word programming to addr, 32-bit memory
port_size = 32;
WR32('CS0+('h0555<<2), 'h00aa); // command sequence
WR32('CS0+('h02aa<<2), 'h0055);
WR32('CS0+('h0555<<2), 'ha0); // command code
WR32('CS0+addr, data); // addr & data
// Polling end of programming
edata = data; // expected data
data = ~edata;
errst = 0;
while(!(data == edata) &&!errst)
begin: BR_EN
RD16('CS0+addr, data); // Read status
if(data[7] != edata[7])
begin
if(data[5] == 1)
begin
RD16('CS0+addr, data3);
RD16('CS0+addr, data);
if(data[6] != data3[6])
begin
$display("CHECK_STATUS: Error timeout on single data program");
errst = 1;
disable BR_EN;
end
end
end
else
begin
RD16('CS0+addr, data3);
if(port_size == 32)
RD32('CS0+addr, data);
else
begin
RD16('CS0+addr, data);
edata[31:16] = 16'h0;
end
end
if(data != edata)
begin
$display("CHECK_STATUS: Error in data write on single data program");
errst = 2;
disable BR_EN;
end
end
end
// Single data word programming to addr, 16-bit memory
port_size = 16;
WR32('CS0+('h0555<<1), 'h00aa); // command sequence
```

```
WR32('CS0+('h02aa<<1), 'h0055);
WR32('CS0+('h0555<<1), 'ha0); // command code
WR32('CS0+addr, data); // addr & data
// Polling end of programming - the same as for 32 bit
```

## 20.7.2 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

### 20.7.2.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM\_CS0GCR1, 'h00210081);
- WR32('EIM\_CS0RCR1, 'h0e020000);
- WR32('EIM\_CS0RCR2, 'h00000000);
- WR32('EIM\_CS0WCR1, 'h0704a040);

### 20.7.2.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h5903<<1), 'h0060);
WR16('CS0+('h5903<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h50214225); // 133 MHz
WR32('EIM_CS0RCR1, 'h0c000000); // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h3103<<1), 'h0060);
WR16('CS0+('h3103<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
//-----
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h5021122d); // 66 MHz
WR32('EIM_CS0RCR1, 'h07000000); // 7cycles on memory
```

### 20.7.2.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
WR16('CS0+addr, 'h0060); // Unlock
WR16('CS0+addr, 'h00d0);
WR16('CS0+addr, 'h0041);
WR16('CS0+addr, data);
WR16('CS0+caddr, 'h0070); // Read Status command
while('CS0+data[7] == 0) // Wait / Polling
    RD16('CS0+addr, data); // Read status
RD16('CS0+addr, data); // Read status
```

```

    WR16('CS0+'h0000,'h00ff);
// Write buffer programming
    WR16('CS0+addr,'h0060);           // Unlock
    WR16('CS0+addr,'h00d0);
    data = 0;
    WR16('CS0+addr, 'h0070);           // Read Status command
    while(data[7] == 0)                 // Wait
        RD16('CS0+addr, data);         // Read status
    WR16('CS0+'h0000,'h00ff);
    WR16('CS0+addr,'h00e9);           // Write Buffer command
    WR16('CS0+addr,255);              // Word counter (<256)
    for(i=0; i<'h200; i = i + 'h40)
        WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
    WR16('CS0+addr,'h00d0);           // Write Confirm command
    data = 0;
    while(data[7] == 0)                 // Wait
        RD16('CS0+addr, data);         // Read status
    RD16('CS0+addr, data);             // Read status
    WR16('CS0+'h0000,'h00ff);

```

### 20.7.3 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

#### 20.7.3.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

#### 20.7.3.2 MDOC Device Asynchronous Mode Configuration

```

// Non-muxed mode
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0e121010);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h12092492);
// Muxed mode
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0e121010);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h12092492);

```

#### 20.7.3.3 MDOC Device Utility

```

// Read Manufacturer ID and Device ID
    RE16('CS0+'h9400,'h4833);
    RE16('CS0+'h9422,'hb7cc);

```

## 20.7.4 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb\_706.

### 20.7.4.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1','h403104b1');
WR32('EIM_CS0RCR1','h0b010000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h0b040040');
// 32 bit memory
WR32('EIM_CS0GCR1','h403304b1');
WR32('EIM_CS0RCR1','h0f010000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h0f040040');
```

### 20.7.4.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1','h403104b1');
WR32('EIM_CS0WCR1','h0b040000');
WR16('CS0+('h85947<<1),'h0040'); // memory configuration
WR32('EIM_CS0GCR1','h4021_5487'); // fixed latency memory wrap 4
WR32('EIM_CS0RCR1','h04000000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h04000000');
// 32 bit memory
WR32('EIM_CS0GCR1','h6003_04f1');
WR32('EIM_CS0WCR1','h0b04_0000');
WR32('CS0+('h85947<<2),'h0040'); // memory configuration
WR32('EIM_CS0GCR1','h4003_1487'); // var latency memory inc. page size 128
WR32('EIM_CS0RCR1','h04000000');
WR32('EIM_CS0RCR2','h00000008');
WR32('EIM_CS0WCR1','h04000000');
```

## 20.7.5 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

### 20.7.5.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]
- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

### 20.7.5.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
WR32('EIM_CS0GCR1,'h00410089);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
```

### 20.7.5.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
WR32('EIM_CS0RCR1,'h05010000);
WR32('EIM_CS0WCR1,'h05040000);
```

### 20.7.5.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
WR16('CS0+('hF100<<1),'h0); // DFS
WR16('CS0+('hF100<<1),'h0); // DBS
WR16('CS0+('hF24c<<1),'h2); // SBA - block number (2)
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
WR16('CS0+('hF220<<1),'h23); // Unlock command
data = 'h0;
while(!(data & 'h0004)) // Polling
    RD32('WIAR, data); // Read status
// Erase block command
WR16('CS0+('hF100<<1),'h2); // DFS and block ([8:0]) address
WR16('CS0+('hF101<<1),'h0); // DBS
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
```

## Typical Application

```
WR16('CS0+('hF220<<1), 'h94); // Erase command
data = 'h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1), 'h2); // DFS and block[8:0] address
WR16('CS0+('hF107<<1), 'h0); // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1), 'h800); // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1), 'h0); // Clear interrupt status
WR16('CS0+('hF220<<1), 'h80); // Program command
data = 'h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
```

## 20.7.6 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

### 20.7.6.1 Samsung UtRAM Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1, 'h400104b1);
WR32('EIM_CS0RCR1, 'h0a010000);
WR32('EIM_CS0RCR2, 'h00000008);
WR32('EIM_CS0WCR1, 'h0b040040);
```

### 20.7.6.2 Samsung UtRAM Synchronous Mode Configuration

```
RD16('CS0+('hff_ffff<<1), data); // command sequence
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_feff<<1), data);
RD16('CS0+('h00_82a0<<1), data); // memory sync. configuration
WR32('EIM_CS0GCR1, 'h4021_53b7); // fixed latency memory wrap 32
WR32('EIM_CS0RCR1, 'h0500_0000);
WR32('EIM_CS0WCR1, 'h0300_0000);
```

## 20.7.7 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

### 20.7.7.1 Spansion Flash Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0a018000);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h0704a240);
WR16('CS0+('hF220<<1), 'h94); // Erase command
data = 'h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
```

```

WR16('CS0+('hF100<<1),'h2);           // DFS and block[8:0] address
WR16('CS0+('hF107<<1),'h0);           // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1),'h800);         // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1),'h0);           // Clear interrupt status
WR16('CS0+('hF220<<1),'h80);           // Program command
data = 'h0;
while(!(data &'h0004))                 // Wait
    RD32('WIAR, data); // Read status

```

### 20.7.7.2 Spansion Flash Synchronous Mode Configuration

```

WR16('CS0+('h0555<<1),'h00aa); // command sequence
WR16('CS0+('h02aa<<1),'h0055);
WR16('CS0+('h0555<<1),'hd0);
WR16('CS0+('h0000<<1),'h1ec4); // memory sync. configuration
WR32('EIM_CS0GCR1,'h50411325); // 66 MHz
WR32('EIM_CS0RCR1,'h05000000); // 5 cycles on memory

```

### 20.7.7.3 Spansion Flash Utility

```

// Single word programming
COMMAND_SEQUENCE(cs,16,'ha0);           // single word programming
WR16('CS0+addr, data);
CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
COMMAND_SEQUENCE(0,16,'h25);           // write buffer programming
WR16('CS0+addr,'h001f);                 // counter-1
WR_I('CS0+addr, data, 'h0010_0001, 16); // data
WR16('CS0+addr,'h0029);                 // write buffer to flash
CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);

```

There `COMMAND_SEQUENCE` and `CHECK_STATUS` are next functions:

```

task COMMAND_SEQUENCE;
    input[2:0]    cs;
    input[7:0]    port_size;
    input[31:0]   code;
begin
    if(port_size == 16)
        begin
            WR16(csba[cs]+('h0555<<1),'h00aa);
            WR16(csba[cs]+('h02aa<<1),'h0055);
            WR16(csba[cs]+('h0555<<1),code);
        end
    else
        begin
            WR32(csba[cs]+('h0555<<2),'h00aa);
            WR32(csba[cs]+('h02aa<<2),'h0055);
            WR32(csba[cs]+('h0555<<2),code);
        end
end
endtask
task CHECK_STATUS;
    input[31:0] addr;
    input[31:0] edata;
    input[7:0]   port_size;
    input[7:0]   opcode;
    output[7:0]  errst;
    reg[31:0]    data;
    reg[31:0]    data3;
begin
    errst = 0;

```

## Typical Application

```
data = 0;
data3 = 0;
while(!(data == edata) && !errst) // Wait operation
begin: BR_EN
RD16(addr, data); // Read status
if(data[7] != edata[7])
begin
if(data[5] == 1)
begin
RD16(addr, data3);
RD16(addr, data);
if(data[6] != data3[6])
begin
$display("CHECK_STATUS: Error timeout on single data program");
errst = 1;
disable BR_EN;
end
end
else
begin
if(opcode == 2)
if(data[1] == 1)
begin
RD16(addr, data3);
if(port_size == 32)
RD32(addr, data);
else
RD16(addr, data);
if(data[1] == 1 && data != edata)
begin
$display("CHECK_STATUS: Error on write buffer");
errst = 3;
disable BR_EN;
end
end
end
end
else
begin
RD16(addr, data3);
if(port_size == 32)
RD32(addr, data);
else
begin
RD16(addr, data);
edata[31:16] = 16'h0;
end
if(data != edata)
begin
$display("CHECK_STATUS: Error in data write on single data program");
errst = 2;
disable BR_EN;
end
end
end
endtask
```

## 20.7.8 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

**Table 20-10. Intel Mode pin connections**

ARM platform Pin	EIM Pin	Notes
ADS#	IPP_DO_ADV_B	WAL = 1, RAL = 1
W/R	IPP_DO_BE_B	WBED = 1
WR#	WE#	
RD#	OE#	

Mot. Mode - For intel mode use the following connection:

**Table 20-11. Motorola Mode pin connections**

ARM platform Pin	EIM Pin	Notes
AS#	IPP_DO_CS_B	
R/W#	WE#	
LDS#	BE#	

## 20.8 External Bus Timing Diagrams

The following timing diagrams show the timing of accesses to memory or a peripheral with different timing parameters. All examples done for CS0, but are valid for any others chip select. BE means one from current used BE[3:0].

## 20.8.1 Asynchronous Read Memory Accesses Timing Diagram

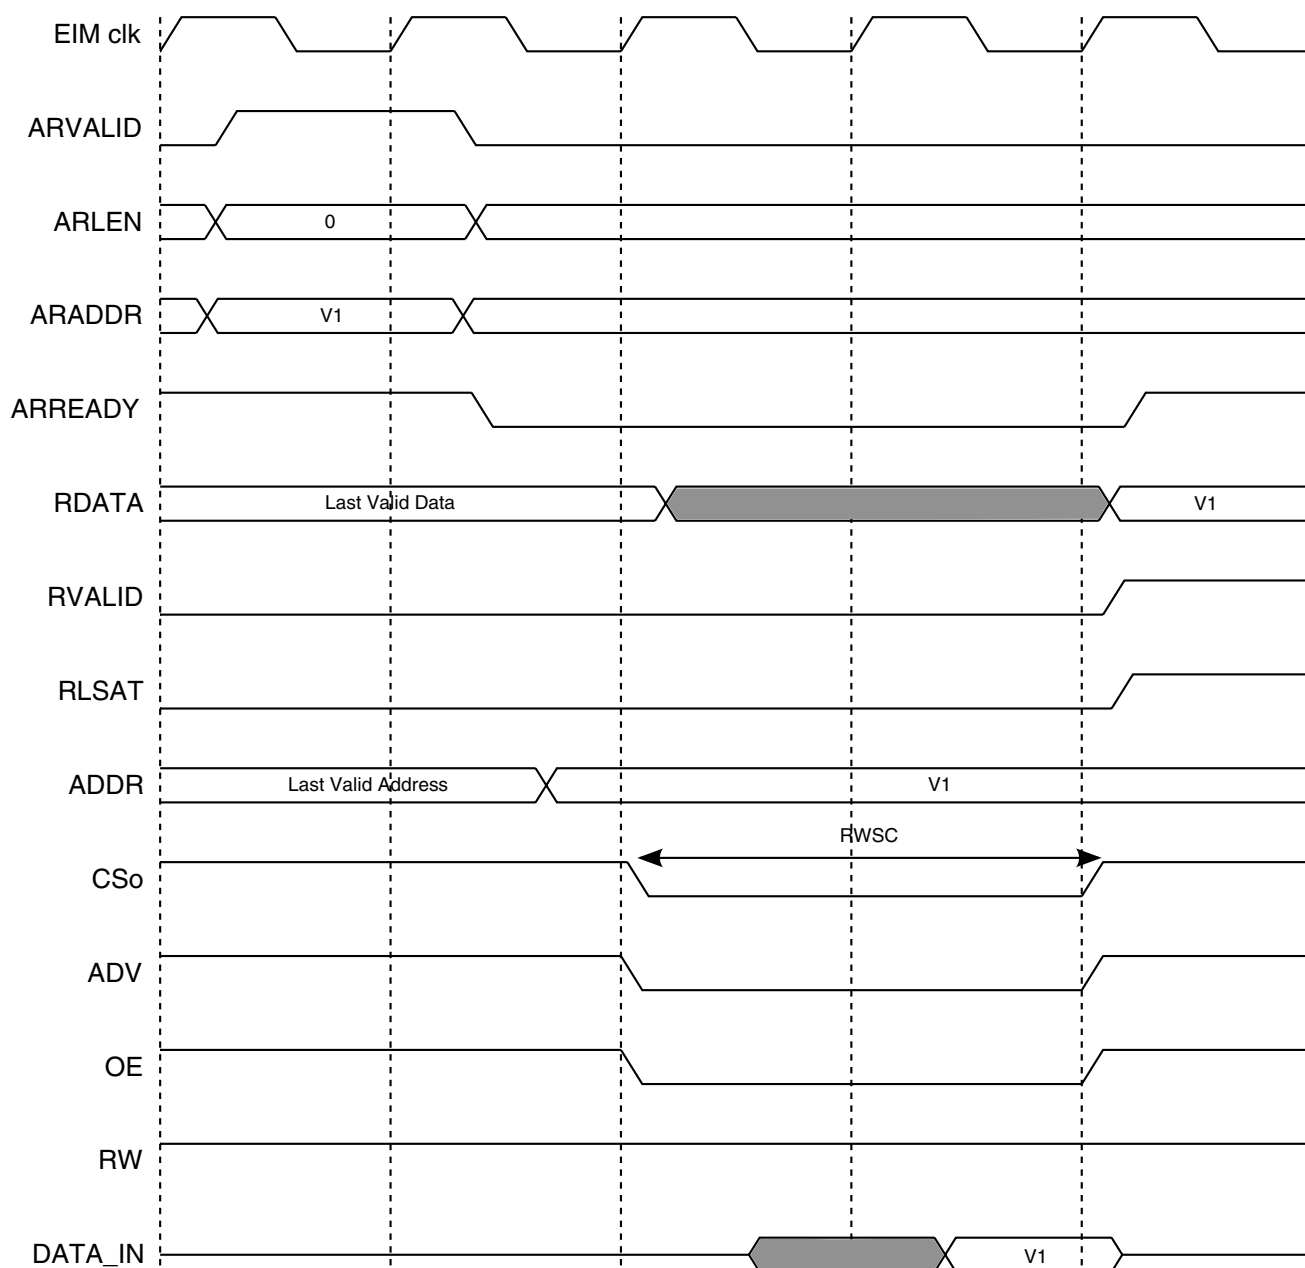

Figure 20-2. Read Access,  $RWSC=2, RCSA=0, OEA=0, RCSN=0, OEN=0, RAL=1$

## 20.8.2 Asynchronous Write Memory Accesses Timing Diagram

## 20.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM\_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM\_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM\_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM\_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM\_CSnRCR2)
- Chip Select n Write Configuration Register (EIM\_CSnWCR)

In addition there are 3 general registers: EIM\_WCR, EIM\_WIAR & EIM\_EAR.

### NOTE

- All EIM registers are sampled by IPG\_CLK\_S, therefore IPG\_CLK\_S must be active when accessing through IP bus.
- Read access from all registers (except EIM\_WIAR & EIM\_EAR) will generate one IPG\_XFR\_WAIT cycle.
- Read access from EIM\_WIAR & EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.
- Write access to all registers (except EIM\_EAR) will generate three IPG\_XFR\_WAIT cycles.
- Write access to EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.

### EIM memory map

EIM\_CS<sub>n</sub>GCR1 field descriptions

Field	Description
31–28 PSZ	<p>Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately.</p> <p>It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset.</p> <p>0000 8 words page size  0001 16 words page size  0010 32 words page size  0011 64 words page size  0100 128 words page size  0101 256 words page size  0110 512 words page size  0111 1024 (1k) words page size  1000 2048 (2k) words page size  1001 - 1111 Reserved</p>
27 WP	<p>Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset.</p> <p>0 Writes are allowed in the memory range defined by chip.  1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.</p>
26–24 GBC	<p>Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only)  001 minimum of 1 EIM clock cycles before next access from different chip select  010 minimum of 2 EIM clock cycles before next access from different chip select  111 minimum of 7 EIM clock cycles before next access from different chip select</p>
23 AUS	<p>Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset.</p> <p>0 Address shifted according to port size (DSZ config.)  1 Address unshifted</p>
22–20 CSREC	<p>CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only)  001 1 EIM clock cycles minimum width of CS, OE and WE signals</p>

*Table continues on the next page...*

**EIM\_CSnGCR1 field descriptions (continued)**

Field	Description
	010 2 EIM clock cycles minimum width of CS, OE and WE signals 111 7 EIM clock cycles minimum width of CS, OE and WE signals
19 SP	Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset.  0 User mode accesses are allowed in the memory range defined by chip select. 1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.
18–16 DSZ	Data Port Size. This bit field defines the width of an external device's data port as shown below.  <b>NOTE:</b> Only async. access supported for 8 bit port.  <b>NOTE:</b> The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001.  000 Reserved. 001 16 bit port resides on DATA[15:0] 010 16 bit port resides on DATA[31:16] 011 32 bit port resides on DATA[31:0] 100 8 bit port resides on DATA[7:0] 101 8 bit port resides on DATA[15:8] 110 8 bit port resides on DATA[23:16] 111 8 bit port resides on DATA[31:24]
15–14 BCS	Burst Clock Start. When SRD=1 or SWR=1, this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated.  When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset.  00 0 EIM clock cycle additional delay 01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay
13–12 BCD	Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset.  <b>NOTE:</b> For other than the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly.  00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
11 WC	Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset.  0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous.
10–8 BL	Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size,

*Table continues on the next page...*

**EIM\_CS $n$ GCR1 field descriptions (continued)**

Field	Description
	<p>type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access.</p> <p>BL is cleared by a hardware reset.</p> <p>When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1.</p> <p>000 4 words Memory wrap burst length (read page burst size when APR = 1)</p> <p>001 8 words Memory wrap burst length (read page burst size when APR = 1)</p> <p>010 16 words Memory wrap burst length (read page burst size when APR = 1)</p> <p>011 32 words Memory wrap burst length (read page burst size when APR = 1)</p> <p>100 Continuous burst length (2 words read page burst size when APR = 1)</p> <p>101 Reserved</p> <p>110 Reserved</p> <p>111 Reserved</p>
7 CREP	<p>Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset.</p> <p><b>NOTE:</b> Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled.</p> <p>For Non-PSRAM memory CREP value should be 1.</p> <p>0 CRE signal is active low</p> <p>1 CRE signal is active high</p>
6 CRE	<p>Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.</p> <p>0 CRE signal use is disable</p> <p>1 CRE signal use is enable</p>
5 RFL	<p>Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset.</p> <p>When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device.</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state</p> <p>1 the state of the External devices is determined internally (Fix latency mode only)</p>
4 WFL	<p>Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset.</p> <p>When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state</p> <p>1 the state of the External devices is determined internally (Fix latency mode only)</p>
3 MUM	<p>Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent).</p>

*Table continues on the next page...*

**EIM\_CSnGCR1 field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0.</p> <p>0 Multiplexed Mode disable 1 Multiplexed Mode enable</p>
2 SRD	<p>Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset.</p> <p><b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.</p> <p>0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode</p>
1 SWR	<p>Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset.</p> <p><b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.</p> <p>0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode</p>
0 CSEN	<p>CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5.</p> <p><b>NOTE:</b> Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0.</p> <p>0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.</p>

## 20.9.2 Chip Select n General Configuration Register 2 (EIM\_CSnGCR2)

Address: 21B\_8000h base + 4h offset + (24d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0		MUX16_BYP_ GRANT	0		DAP	DAE	DAPS	DAPS	DAPS	DAPS	DAPS	0		ADH	
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

**EIM\_CSnGCR2 field descriptions**

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_ GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses).  0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset.  0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset.  0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses.

*Table continues on the next page...*

**EIM\_CS*n*GCR2 field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access.</p> <p>DAPS is cleared by a hardware reset.</p> <p>Example settings:</p> <p>0000 3 EIM clk cycle between start of access and first <math>\overline{DTACK}</math> check</p> <p>0001 4 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>0010 5 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>0111 10 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>1011 14 EIM clk cycles between start of access and first DTACK check</p> <p>1111 18 EIM clk cycles between start of access and first DTACK check</p>
3–2 Reserved	This read-only field is reserved and always has the value 0.
1–0 ADH	<p>Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode).</p> <p>When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched.</p> <p><b>NOTE:</b> Reset value for EIM_CS0GCR2 for ADH is 10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 00.</p> <p>00 0 cycle after ADV negation</p> <p>01 1 cycle after ADV negation</p> <p>10 2 cycle after ADV negation</p> <p>11 Reserved</p>

**20.9.3 Chip Select *n* Read Configuration Register 1 (EIM\_CS*n*RCR1)**

**EIM\_CS*n*RCR1 field descriptions**

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.

*Table continues on the next page...*

**EIM\_CS $n$ RCR1 field descriptions (continued)**

Field	Description
29–24 RWSC	<p>Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select.</p> <p>When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>RWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved  000001 RWSC value is 1  000010 RWSC value is 2  111101 RWSC value is 61  111110 RWSC value is 62  111111 RWSC value is 63</p>
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion  001 1 EIM clock cycles between beginning of access and ADV assertion  010 2 EIM clock cycles between beginning of access and ADV assertion  111 7 EIM clock cycles between beginning of access and ADV assertion</p>
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses.</p> <p>When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access.</p> <p>When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset.</p> <p><b>NOTE:</b> the reset value for EIM_CS0RCR1[RADVN] = 2. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000.</p> <p><b>NOTE:</b> This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.</p>

*Table continues on the next page...*

**EIM\_CS $n$ RCR1 field descriptions (continued)**

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	<p>OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset.</p> <p>In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH +1) EIM clock cycles from start of access.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RCR1 is 0b010. The reset value of this field for EIM_CS1RCR1 - EIM_CS5RCR1 is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and OE assertion  001 1 EIM clock cycles between beginning of access and OE assertion  010 2 EIM clock cycles between beginning of access and OE assertion  111 7 EIM clock cycles between beginning of access and OE assertion</p>
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	<p>OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 &amp; APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and OE negation  001 1 EIM clock cycles between end of access and OE negation  010 2 EIM clock cycles between end of access and OE negation  111 7 EIM clock cycles between end of access and OE negation</p>
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	<p>Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of read access and CS assertion  001 1 EIM clock cycles between beginning of read access and CS assertion  010 2 EIM clock cycles between beginning of read access and CS assertion  111 7 EIM clock cycles between beginning of read access and CS assertion</p>
3 Reserved	This read-only field is reserved and always has the value 0.
2–0 RCSN	<p>Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 &amp; APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of read access and CS negation  001 1 EIM clock cycles between end of read access and CS negation  010 2 EIM clock cycles between end of read access and CS negation  111 7 EIM clock cycles between end of read access and CS negation</p>

### EIM\_CSnRCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored.  APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.  <b>NOTE:</b> SRD=0 and MUM=0 must apply when APR=1
14–12 PAT	Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored.  PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.  000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units.  This field is cleared by a hardware reset.  00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0

Table continues on the next page...

**EIM\_CS<sub>n</sub>RCR2 field descriptions (continued)**

Field	Description
10	Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0
11	Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RBEA	Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion
3 RBE	Read BE enable. This bit field determines if BE will be asserted during read access.  0 - BE are disabled during read access. 1- BE are enable during read access according to value of RBEA & RBEN bit fields.
2–0 RBEN	Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation

## 20.9.5 Chip Select n Write Configuration Register 1 (EIM\_CS<sub>n</sub>WCR1)

Address: 21B\_8000h base + 10h offset + (24d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EIM\_CS<sub>n</sub>WCR1 field descriptions**

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADV <sub>N</sub> bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADV <sub>N</sub> bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses. This bit is cleared by hardware reset.
29–24 WWSC	<p>Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select.</p> <p>When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>WWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved  000001 WWSC value is 1  000010 WWSC value is 2  000011 WWSC value is 3  111111 WWSC value is 63</p>
23–21 WADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion  001 1 EIM clock cycles between beginning of access and ADV assertion  010 2 EIM clock cycles between beginning of access and ADV assertion  111 7 EIM clock cycles between beginning of access and ADV assertion</p>
20–18 WADV <sub>N</sub>	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses.</p> <p>When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADV<sub>N</sub> + WADVA + BCD + BCS + 1) EIM clock cycles.</p> <p>When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADV<sub>N</sub> + WADVA + 1) EIM clock cycles.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WADV<sub>N</sub> is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p><b>NOTE:</b> This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.</p>
17–15 WBEA	BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset.

*Table continues on the next page...*

**EIM\_CS<sub>n</sub>WCR1 field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> Reset value for EIM_CS0WCR for WBEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and BE assertion</p> <p>001 1 EIM clock cycles between beginning of access and BE assertion</p> <p>010 2 EIM clock cycles between beginning of access and BE assertion</p> <p>111 7 EIM clock cycles between beginning of access and BE assertion</p>
14–12 WBEN	<p>BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in async. mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WBEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and WE negation</p> <p>001 1 EIM clock cycles between end of access and WE negation</p> <p>010 2 EIM clock cycles between end of access and WE negation</p> <p>111 7 EIM clock cycles between end of access and WE negation</p>
11–9 WEA	<p>WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion</p> <p>001 1 EIM clock cycles between beginning of access and WE assertion</p> <p>010 2 EIM clock cycles between beginning of access and WE assertion</p> <p>111 7 EIM clock cycles between beginning of access and WE assertion</p>
8–6 WEN	<p>WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion</p> <p>001 1 EIM clock cycles between beginning of access and WE assertion</p> <p>010 2 EIM clock cycles between beginning of access and WE assertion</p> <p>111 7 EIM clock cycles between beginning of access and WE assertion</p>
5–3 WCSA	<p>Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of write access and CS assertion</p>

*Table continues on the next page...*

**EIM\_CS<sub>n</sub>WCR1 field descriptions (continued)**

Field	Description
	001 1 EIM clock cycles between beginning of write access and CS assertion 010 2 EIM clock cycles between beginning of write access and CS assertion 111 7 EIM clock cycles between beginning of write access and CS assertion
2–0 WCSN	Write CS Negation. This bit field determines when CS signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WCSN is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

**20.9.6 Chip Select n Write Configuration Register 2 (EIM\_CS<sub>n</sub>WCR2)**

Address: 21B\_8000h base + 14h offset + (24d × i), where i=0d to 5d

Hardware Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

### EIM\_WCR field descriptions

Field	Description
31–12 Reserved	Reserved This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WD OG_ LIMIT	Memory Watch Dog (WDog) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtrack mode) before the wdog counter terminates the access and send an error response to the master.  00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WD OG_ EN	Memory WDog enable. This bit controls the operation of the wdog counter that terminates the EIM access.  0 Memory WDog is Disabled 1 Memory WDog is Enabled

Table continues on the next page...

**EIM\_WCR field descriptions (continued)**

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt.  0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset.  0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_SEL	Continuous BCLK select  When this bit is set BCLK pin output continuous clock. Otherwise, BCLK will output clock only when nesserary.  0 BCLK When nesserary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GB CD bit field has no influence. GB CD is cleared by a hardware reset.  00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset.  <b>NOTE:</b> The BCLK frequency in this mode is according to GB CD bit field.  <b>NOTE:</b> The BCLK phase is opposite to the EIM clock in this mode if GB CD is 0.  <b>NOTE:</b> This bit should be used only in async. accesses. No sync access can be executed if this bit is set.  <b>NOTE:</b> When this bit is set bcd field shouldn't be configured to 0.  0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

## 20.9.8 DLL Control Register (EIM\_DCR)

Address: 21B\_8000h base + 94h offset = 21B\_8094h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	DLL_CTRL_REF_UPDATE_INT				DLL_CTRL_SLV_UPDATE_INT					DLL_CTRL_REF_INITIAL_VAL							
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_CTRL_SLV_OVERRIDE_VAL								DLL_CTRL_SLV_OVERRIDE	DLL_CTRL_GATE_UPDATE	DLL_CTRL_SLV_OFFSET		DLL_CTRL_SLV_OFFSET_DEC	DLL_CTRL_SLV_FORCE_UPD	DLL_CTRL_RESET	DLL_CTRL_ENABLE
W											DLL_CTRL_SLV_OFFSET					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EIM\_DCR field descriptions

Field	Description
31–28 DLL_CTRL_REF_UPDATE_INT	Reference DLL Update Interval  DLL control loop update interval. The interval cycle is $(2 + \text{REF\_UPDATE\_INT}) \times \text{ref\_clock}$ . By default, the DLL control loop shall update every two ref_clock cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–23 DLL_CTRL_SLV_UPDATE_INT	Slave DLL Update Interval  If default 0 is used, it means 256 cycles of ref_clock. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
22–16 DLL_CTRL_REF_INITIAL_VAL	This field is used to select the initial value of reference chain before DLL enabled. It's recommended to set the initial value close to the locked value to accelerate the locking.
15–9 DLL_CTRL_SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

**EIM\_DCR field descriptions (continued)**

Field	Description
7 DLL_CTRL_ GATE_UPDATE	Set this bit to 1 to force DLL not update from now on. Since when clock exists, glitches might appear during update. This bit is used by software if we met such kind of condition. Set it to 0 to let DLL update automatically
6-4 DLL_CTRL_ SLV_OFFSET	OFFSET value for DLL_CTRL_SLV_SEL
3 DLL_CTRL_ SLV_OFFSET_ DEC	Slave Chain Offset Decrease  Decrease(or increase) the value defined by DLL_CTRL_SLV_OFFSET when calculating DLL_STS_SLV_SEL  0 DLL_STS_SLV_SEL = DLL_STS_REF_SEL + DLL_CTRL_SLV_OFFSET 1 DLL_STS_SLV_SEL = DLL_STS_REF_SEL - DLL_CTRL_SLV_OFFSET
2 DLL_CTRL_ SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when EIM is idle.
1 DLL_CTRL_ RESET	DLL Reset Bit  Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-lock. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again
0 DLL_CTRL_ ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled

**20.9.9 DLL Status Register (EIM\_DSR)**

Address: 21B\_8000h base + 98h offset = 21B\_8098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_STS_REF_SEL								DLL_STS_SLV_SEL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EIM\_DSR field descriptions**

Field	Description
31–16 Reserved	Reserved  This read-only field is reserved and always has the value 0.
15–9 DLL_STS_REF_SEL	Reference delay line select taps. Be noted this is encoded by 7 bits for 127taps.
8–2 DLL_STS_SLV_SEL	Slave delay line select status. This is the instant value generated from reference chain. Since only when ref_lock is detected can the reference chain get updated, this value should be the right value next be update to the slave line when reference is locked.
1 DLL_STS_REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to feedback BCLK, allowing the slave delay-line to perform programmed clock delays
0 DLL_STS_SLV_LOCK	Slave delay-line lock status. This signifies that a valid delay has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

**20.9.10 EIM IP Access Register (EIM\_WIAR)**

Address: 21B\_8000h base + 9Ch offset = 21B\_809Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															
W													ACLK_EN	ERRST	INT	IPS_ACK
Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

**EIM\_WIAR field descriptions**

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 ACLK_EN	ACLK enable. This bit gates the ACLK for the EIM except from FFs that get ipg_aclk_s. After reset ACLK is enabled.  0 ACLK is disabled 1 ACLK is enabled

*Table continues on the next page...*

**EIM\_WIAR field descriptions (continued)**

Field	Description
3 ERRST	<p>READY After Reset. This bit controls the initial ready/busy status for external devices on CS0 immediately after hardware reset. This is a sticky bit which is cleared once the RDY_INT signal is asserted by the external device.</p> <p>When ERRST = 1 the first fetch access from EIM to the external device located on CS0 will be pending until RDY_INT signal indicates that the external device is ready, then EIM will execute the access.</p> <p><b>NOTE:</b> Reset value for ERRST is EIM_BOOT[4].</p> <p>0 RDY_INT After Reset Disable 1 RDY_INT After Reset Enable</p>
2 INT	<p>Interrupt. This bit indicates interrupt assertion by an external device according to RDY_INT signal. When polling this bit, INT=0 indicates interrupt not occurred and INT=1 indicates assertion of the external device interrupt. This bit is cleared by a hardware reset.</p>
1 IPS_ACK	<p>IPS ACK. The EIM is ready for ips access. There is no active AXI access and no new AXI access is accepted till this bit is cleared. This bit is cleared by the master after it completes the ips accesses.</p> <p>0 Master cannot access ips. 1 Master can access ips.</p>
0 IPS_REQ	<p>IPS request. The Master requests to access one of the IPS registers. During such access the EIM should not perform any AXI/memory accesses. The EIM finishes the AXI accesses that already starts and asserts the IPS_ACK bit.</p> <p>0 No Master requests ips access 1 Master requests ips access</p>

**20.9.11 Error Address Register (EIM\_EAR)**

Address: 21B\_8000h base + A0h offset = 21B\_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EIM\_EAR field descriptions**

Field	Description
31–0 Error_ADDR	Error Address. This bit field holds the AXI address of the last access that caused error. This register is read only register.

# Chapter 21

## Enhanced LCD Interface (eLCDIF)

### 21.1 Overview

The eLCDIF is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The eLCDIF block supports these interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

### 21.2 External Signals

The following table describes the external signals of LCD:

**Table 21-1. LCD External Signals**

Signal	Description	Pad	Mode	Direction
LCD_BUSY	Busy Signal	LCD_RESET	ALT2	I
LCD_CLK	Clock signal	LCD_CLK	ALT0	I
LCD_CS	Chip select	LCD_HSYNC	ALT2	O
LCD_DATA00	Data signal	KEY_COL0	ALT2	IO
		LCD_DAT0	ALT0

## 21.3 Clocks

The following table describes the clock sources for eLCDIF. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 21-2. eLCDIF Clocks**

Clock name	Clock Root	Description
apb_clk	lcdif_axi_clk_root	AXI clock
pix_clk	lcdif_pix_clk_root	Pixel clock

## 21.4 Functional Description

[Bus Interface Mechanisms](#) through [Initializing the eLCDIF](#), describe the internal pipeline for the MPU write/read interface, VSYNC, DOTCLK, and DVI interfaces. Differences for each mode are then described in separate sections, as follows:

- [MPU Interface](#)
- [VSYNC Interface](#)
- [DOTCLK Interface](#)
- [ITU-R BT.656 Digital Video Interface \(DVI\)](#)

eLCDIF pin usage by interface mode is described in [eLCDIF Pin Usage by Interface Mode](#).

**Figure 21-1. Top-Level Block Diagram of eLCDIF subsystem**

### 21.4.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution.

The following sections describe the system bus interface mechanisms.

### **21.4.1.1 Bus Master Operation in Write/Display Modes**

The eLCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF\_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC modes, single frames are transferred. When a complete frame is transferred, eLCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the eLCDIF setup sequence should be repeated.

The DOTCLK and DVI modes are used to refresh the display at the desired refresh rate and resolution. These modes are used to drive displays that do not integrate a display buffer memory. When the display is refreshed, the eLCDIF will automatically update the LCDIF\_CUR\_BUF\_ADDR register with the value in LCDIF\_NEXT\_BUF\_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF\_NEXT\_BUF\_ADDR register was not updated within a frame refresh cycle, eLCDIF will keep transmitting the last frame until a new value is programmed into that register.

eLCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE\_FIELDS bit in the LCDIF\_CTRL1 register.

### **21.4.1.2 System Bus Master Performance**

The performance of the eLCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF\_CTRL2 register will throttle system memory requests. The LCDIF\_CTRL2\_OUTSTANDING\_REQS field will control how many requests the eLCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF\_CTRL2\_BURST\_LEN\_8 bit will set the number of 64 bit words requested for each eLCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display resolution. These configuration bits are intended to change the access pattern of the eLCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF\_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF\_THRES\_PANIC value can be used to raise the priority of requests initiated by the eLCDIF to alter how the eLCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF\_THRES\_PANIC value to  $3/4 * 512$ , or 128. The panic signal output is used to assess higher priority to eLCDIF system requests to avoid eLCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF\_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

## 21.4.2 Write Data Path

eLCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The INPUT\_DATA\_SWIZZLE field in the LCDIF\_CTRL register provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The WORD\_LENGTH field of LCDIF\_CTRL register indicates the input data/pixel format. LCDIF\_TRANSFER\_COUNT register denotes how much data is contained in each frame. The H\_COUNT field of this register indicates the number of pixels per line and V\_COUNT indicates the total number of lines per frame. A special bit field in the LCDIF\_CTRL1 register, called the BYTE\_PACKING\_FORMAT, can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, BYTE\_PACKING\_FORMAT should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then BYTE\_PACKING\_FORMAT should be set to 0x7.

The LCD\_DATABUS\_WIDTH field in LCDIF\_CTRL register suggests the width of the bus going to the external display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. Refer to the system I/O muxing options for support of this feature. If the LCD\_DATABUS\_WIDTH is not the

same as WORD\_LENGTH, eLCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, eLCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, eLCDIF will drop the LSBs of each color channel to convert to the lower color depth. eLCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the ODD\_LINE\_PATTERN and the EVEN\_LINE\_PATTERN bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

eLCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF\_CSC\* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- WORD\_LENGTH=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of BYTE\_PACKING\_FORMAT [3:0] is permissible.

Limitation: H\_COUNT must be a multiple of the sum of BYTE\_PACKING\_FORMAT [3], BYTE\_PACKING\_FORMAT [2], BYTE\_PACKING\_FORMAT [1] and BYTE\_PACKING\_FORMAT [0].  
LCD\_DATABUS\_WIDTH must be 1, indicating an 8-bit data bus.

- WORD\_LENGTH=0 implies the input frame buffer is RGB 16 bits per pixel. DATA\_FORMAT\_16\_BIT field determines the pixels are RGB 555 or RGB 565.

Limitation: BYTE\_PACKING\_FORMAT [3:0] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and H\_COUNT will be restricted to be a multiple of 2 pixels.

- WORD\_LENGTH=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the DATA\_FORMAT\_18\_BIT bit.

Limitation: BYTE\_PACKING\_FORMAT can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case. H\_COUNT can be any number.

- WORD\_LENGTH=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If BYTE\_PACKING\_FORMAT [3:0] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on H\_COUNT. This is also

the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If BYTE\_PACKING\_FORMAT [3:0] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and H\_COUNT must be a multiple of 4 pixels.

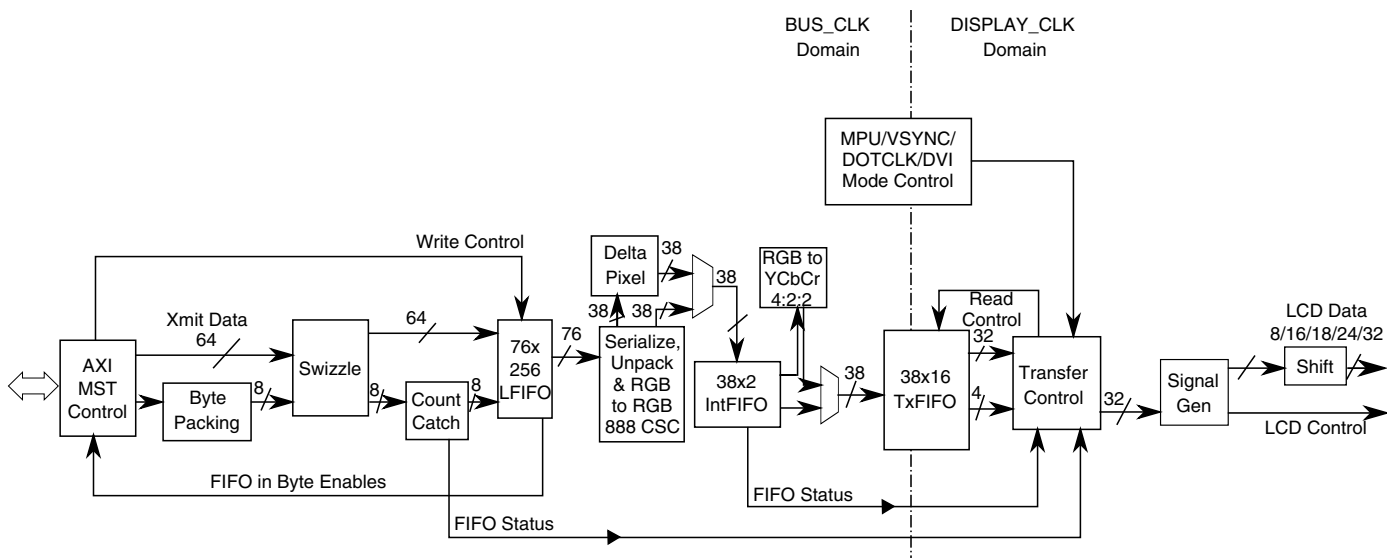

- YCBCR422\_INPUT=1 implies that the input frame is in YCbCr 4:2:2 format. BYTE\_PACKING\_FORMAT must be 0xF.

Limitation: LCD\_DATABUS\_WIDTH must be 8-bit and H\_COUNT must be a multiple of 2 pixels.

ODD\_LINE\_PATTERN and EVEN\_LINE\_PATTERN must be 0 when any of RGB\_TO\_YCBCR422\_CSC or INTERLACE\_FIELDS or YCBCR422\_INPUT bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the CSC\_DATA\_SWIZZLE field in the LCDIF\_CTRL register, and it provides the same options as the INPUT\_DATA\_SWIZZLE register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the SHIFT\_DIR and SHIFT\_NUM\_BITS fields in LCDIF\_CTRL register.

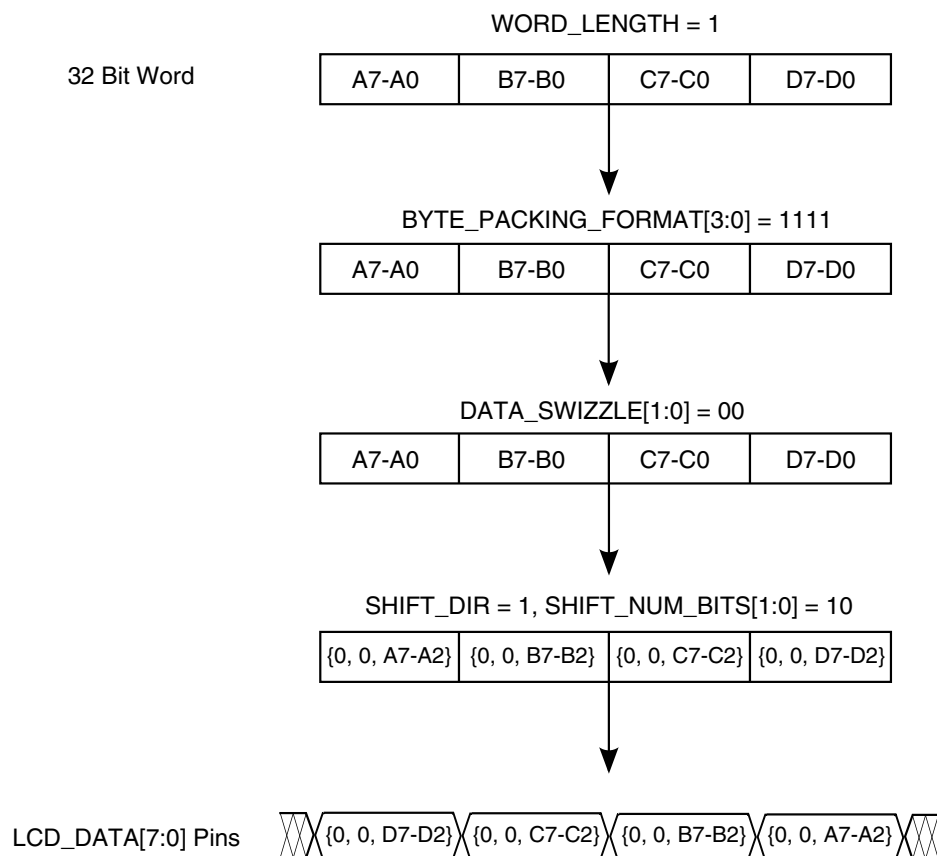

**Figure 21-2. General Operations in Write Data Path**

## Functional Description

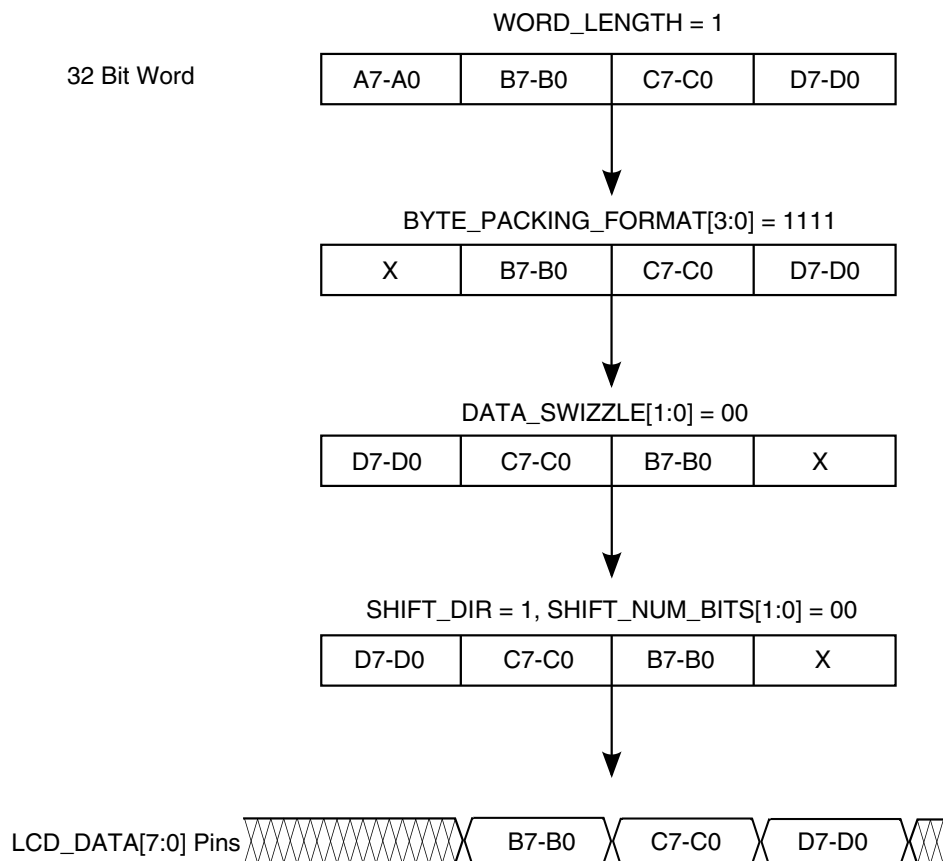

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to I/O bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

**Figure 21-3. Register programming for write mode**

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

**Figure 21-4. Register programming for write mode**

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

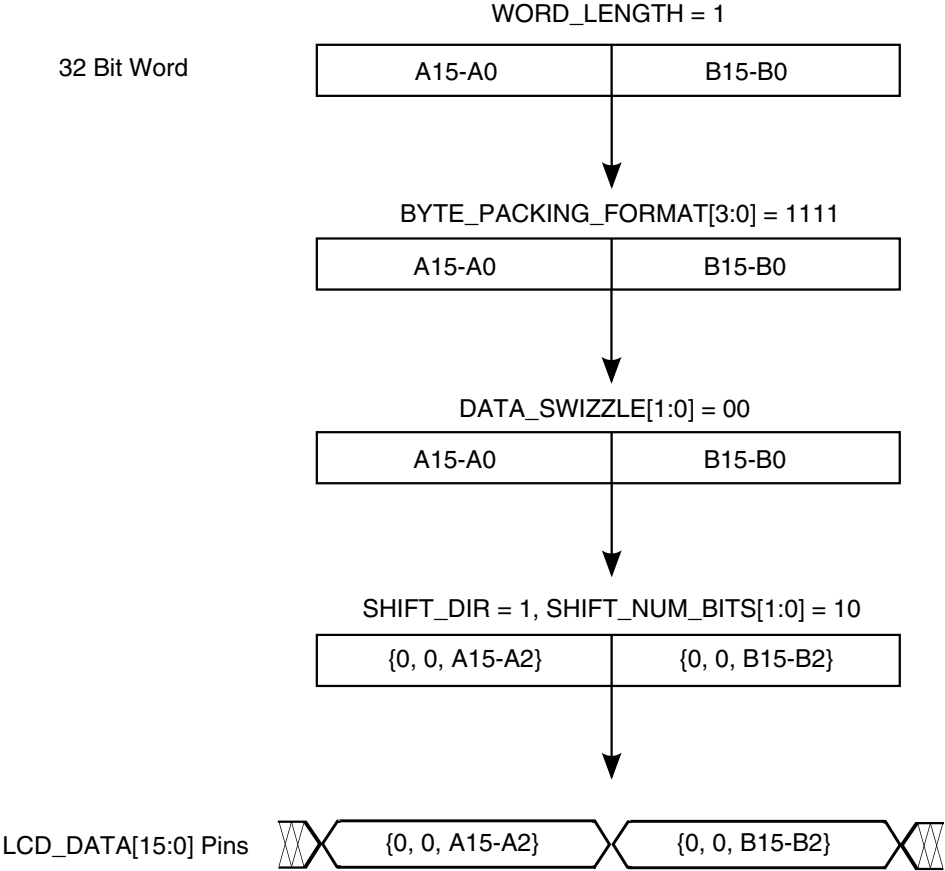

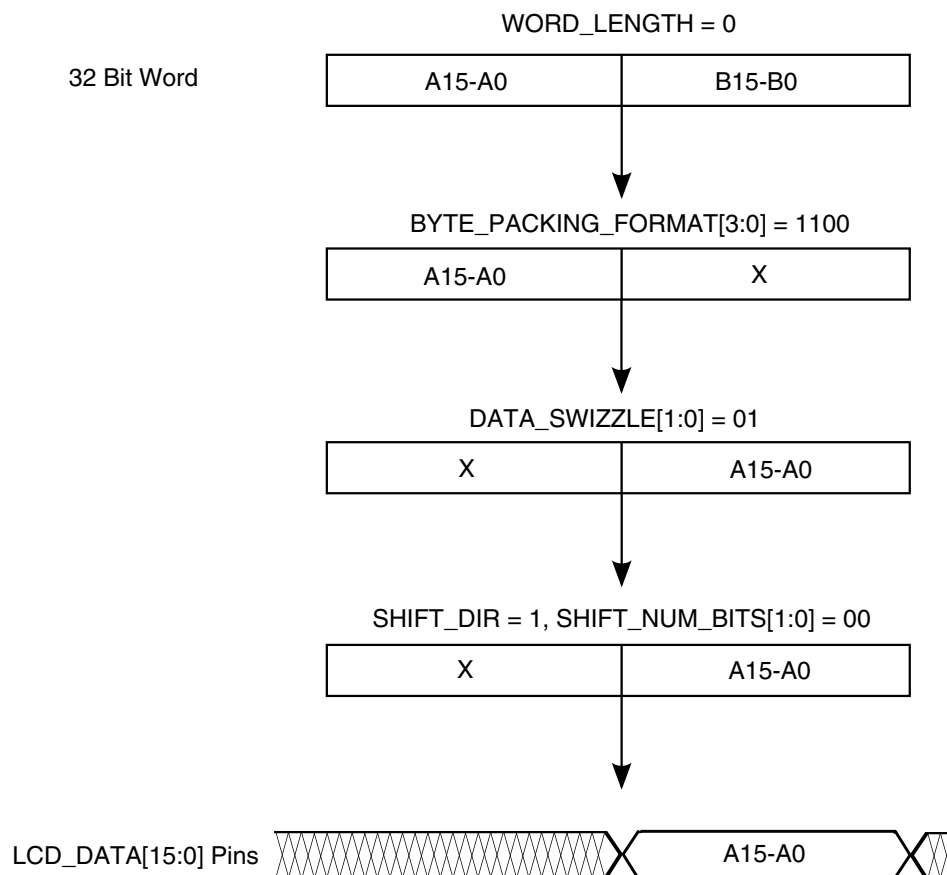

Figure 21-5. Register programming for write mode

This example indicates how an unpacked frame buffer can be sourced for display. Only a single 16 bit half word within the 32 bit word is transferred out via the 16 display bus.

### Figure 21-6. Register programming for write mode

### 21.4.3 Read Data Path

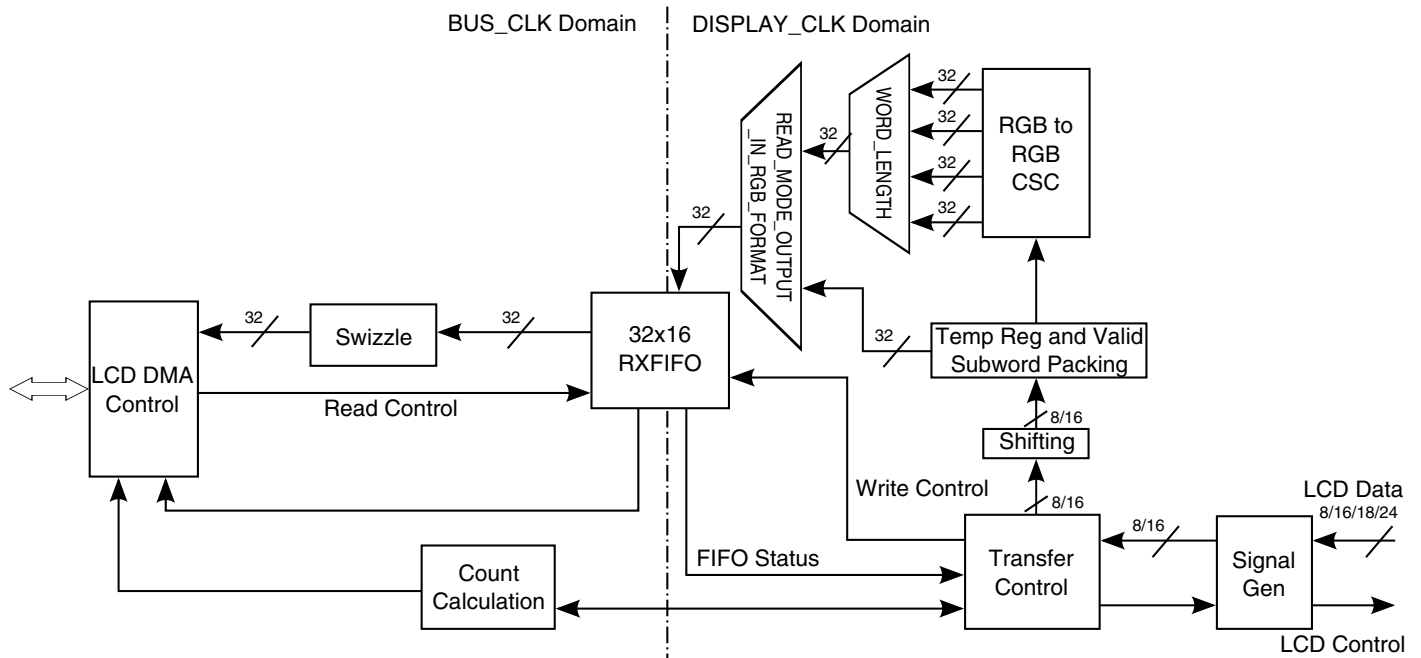

Figure 21-7 shows the MPU read data path in detail.

eLCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the LCD\_DATABUS\_WIDTH bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the READ\_MODE\_NUM\_PACKED\_SUBWORDS bit field. The INITIAL\_DUMMY\_READ bit field directs the eLCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. SHIFT\_DIR and SHIFT\_NUM\_BITS bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in READ\_MODE\_NUM\_PACKED\_SUBWORDS if lcd

## Functional Description

databus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

**Figure 21-7. MPU Read Data Path**

After the last subword within a word is reached, the block looks at the READ\_PACK\_DIR in the HW\_LCDIF\_CTRL2 register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the READ\_MODE\_OUTPUT\_IN\_RGB\_FORMAT bit is set, eLCDIF will convert the data obtained from the READ\_PACK\_DIR operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the WORD\_LENGTH field. The DATA\_FORMAT\_16/18/24\_BIT bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if DATA\_FORMAT\_18\_BIT is 1, the RGB666 data will be packed in the upper bits [31:4] of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

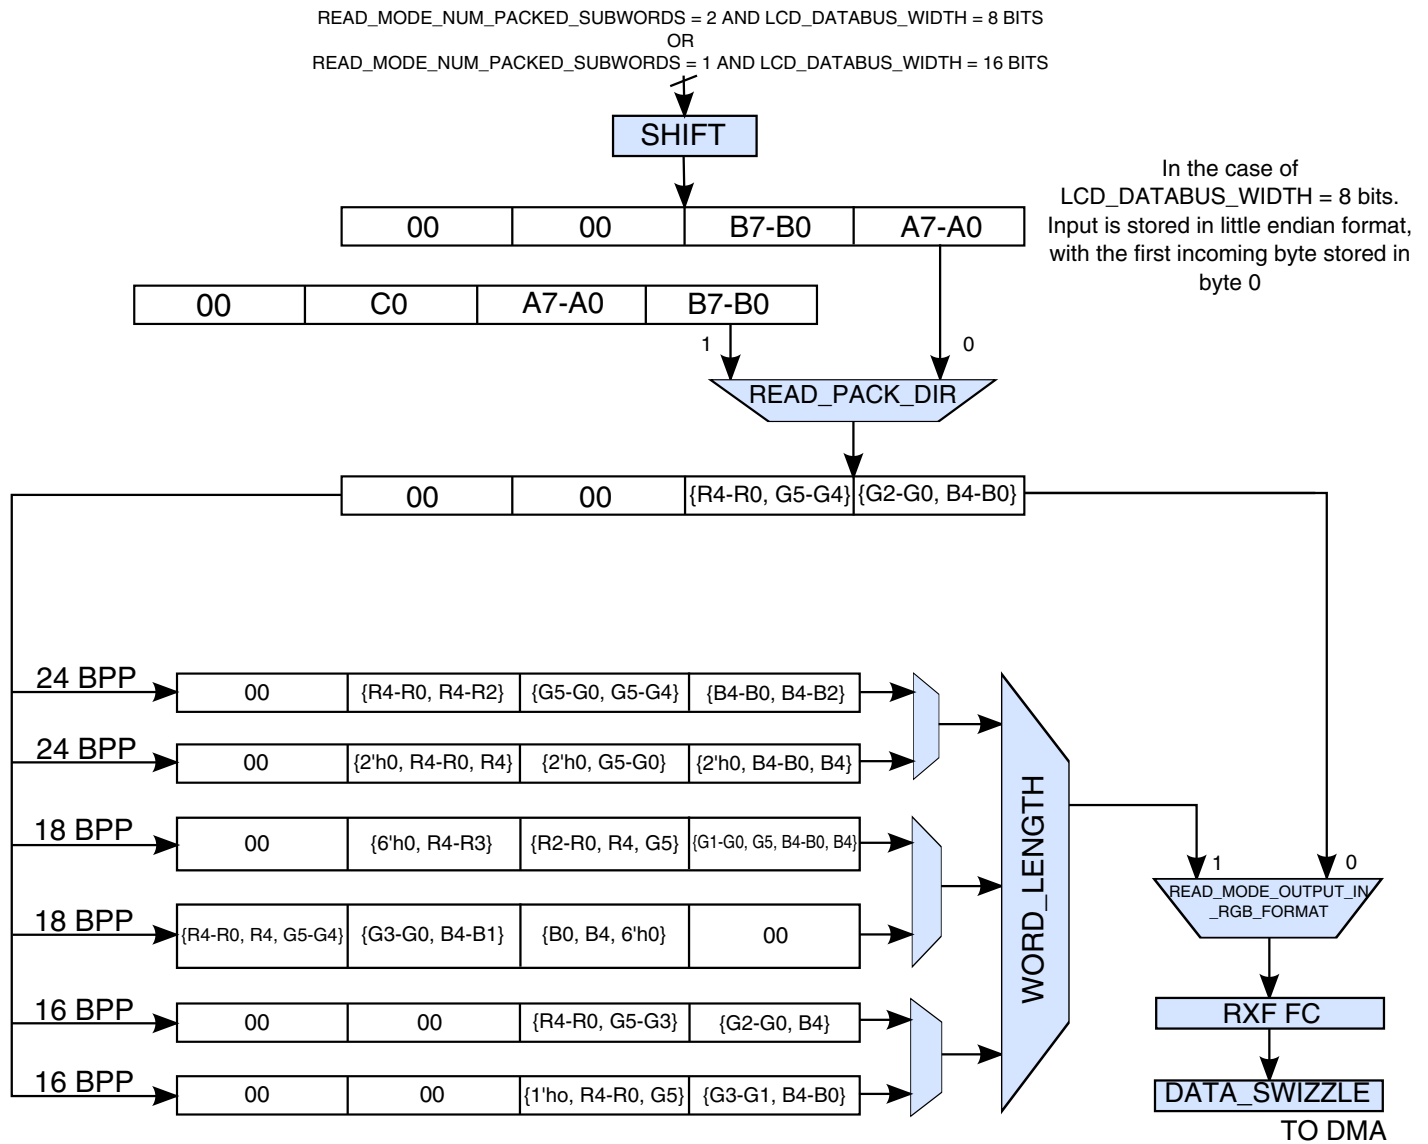

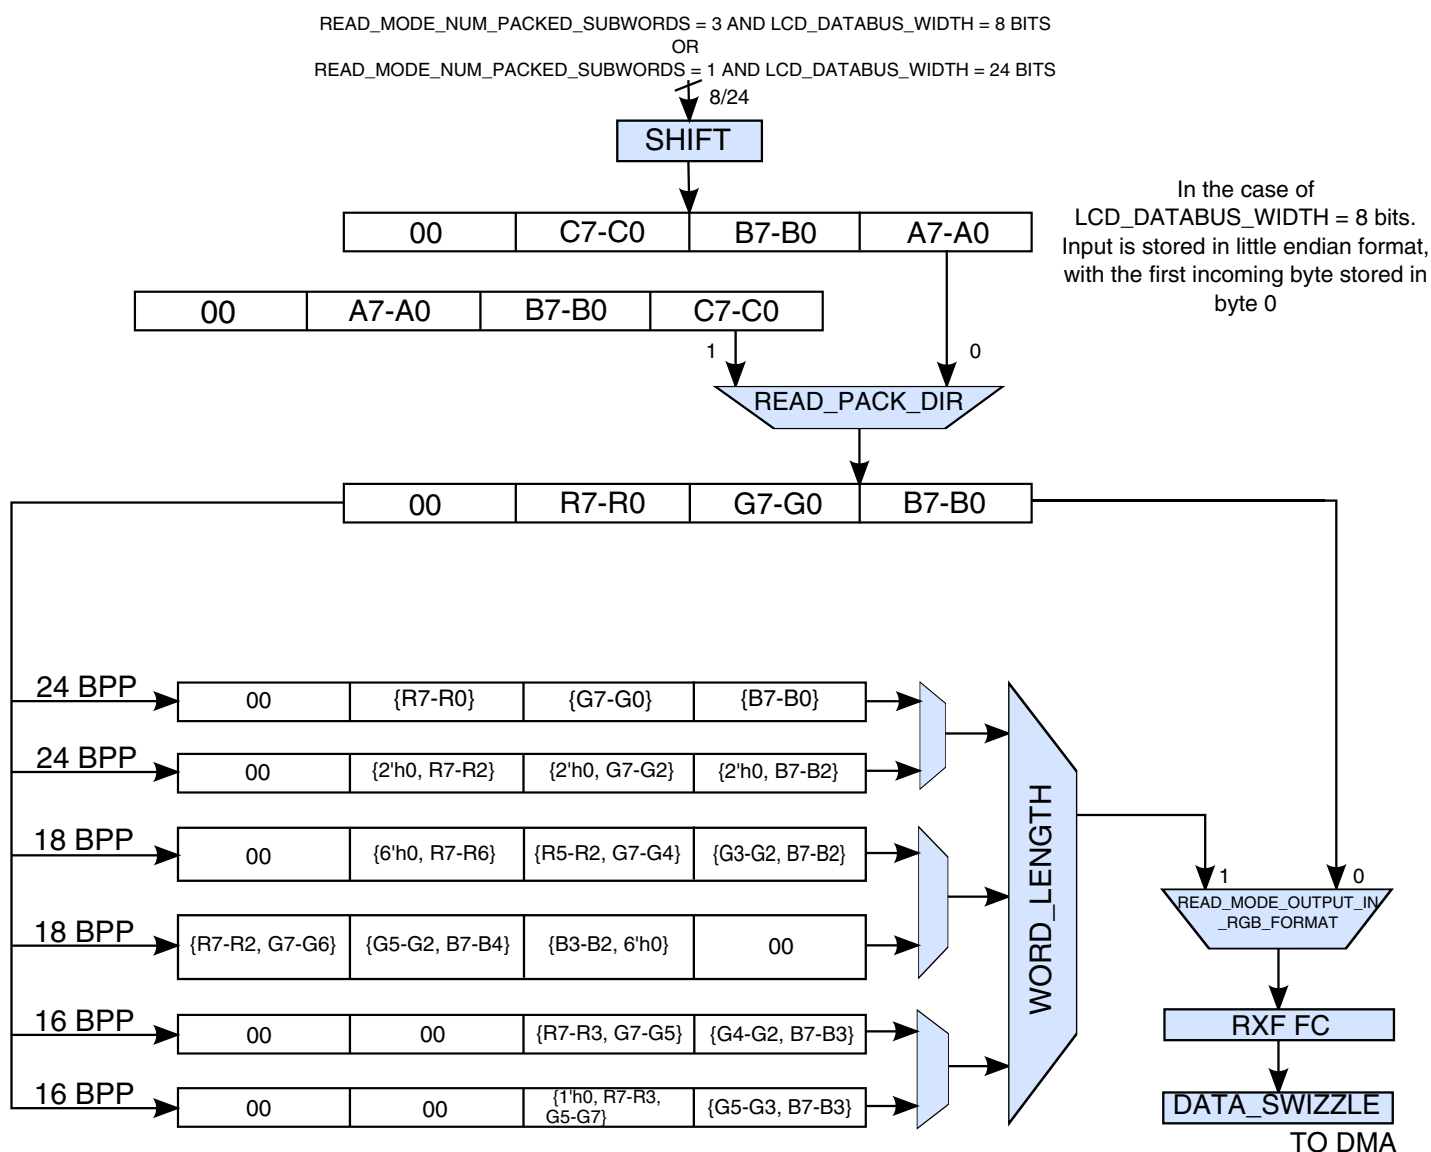

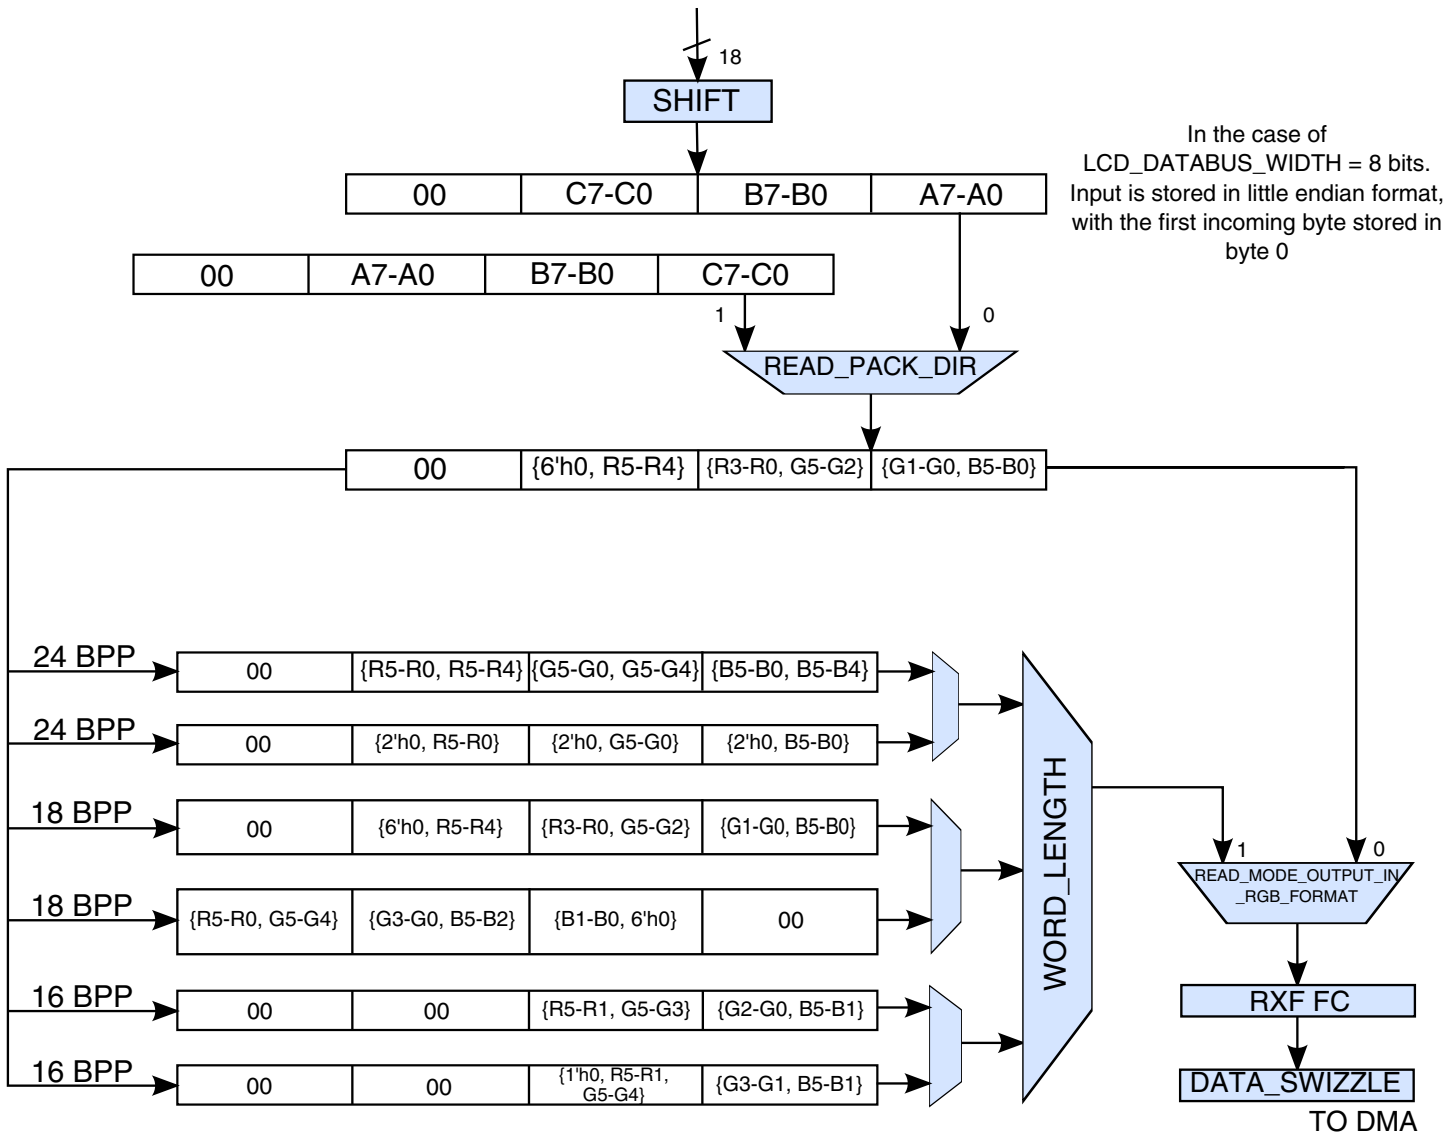

Figure 21-8. Data in MPU read mode

## Functional Description

**Figure 21-9. Data in MPU read mode**

READ\_MODE\_NUM\_PACKED\_SUBWORDS = 1 AND LCD\_DATABUS\_WIDTH = 18 BITS

**Figure 21-10. Data in MPU read mode**

#### Restrictions:

READ\_PACK\_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA\_SWIZZLE field should be used to swizzle across bytes.

READ\_PACK\_DIR must be 0 if LCD\_DATABUS\_WIDTH is 8 bits and READ\_MODE\_NUM\_PACKED\_SUBWORDS = 1

If READ\_MODE\_OUTPUT\_IN\_RGB\_FORMAT bit is set, the following restrictions should be followed:

- If LCD\_DATABUS\_WIDTH = 8 bits, then  
READ\_MODE\_NUM\_PACKED\_SUBWORDS <= 3.
- If LCD\_DATABUS\_WIDTH = 16/18/24 bits, then  
READ\_MODE\_NUM\_PACKED\_SUBWORDS = 1.

## 21.4.4 eLCDIF Interrupts

eLCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by eLCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than its FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur\_frame\_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ\_ON\_ALTERNATE\_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

## 21.4.5 Initializing the eLCDIF

This section describes write modes and MPU read mode.

### 21.4.5.1 Write Modes

The following initialization steps are common to all eLCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY\_CLK clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS\_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF\_CTRL1\_RESET bit appropriately, being careful to observe the reset requirements of the controller. See [Behavior During Reset](#) for more information on Reset requirements.
6. Make sure READ\_WRITEB bit in HW\_LCDIF\_CTRL register is 0.
7. Select the transfer mode of operation. The LCDIF\_MASTER bit in HW\_LCDIF\_CTRL register determines the transfer mode selected. Bus master (LCDIF\_MASTER =1) or PIO (LCDIF\_MASTER =0) mode are the transfer modes to select.
8. Set the INPUT\_DATA\_SWIZZLE according to the endianness of the LCD controller. Also, set the DATA\_SHIFT\_DIR and SHIFT\_NUM\_BITS if it is required to shift the data left or right before it is output.
9. Set the WORD\_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in HW\_LCDIF\_CTRL register.
10. Set the BYTE\_PACKING\_FORMAT field in HW\_LCDIF\_CTRL1 according to the input frame.
11. Set the LCD\_DATABUS\_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

### 21.4.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY\_CLK and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS\_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF\_CTRL1\_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ\_WRITEB bit in LCDIF\_CTRL register to 1.
7. Set the LCDIF\_MASTER bit in LCDIF\_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the DATA\_SHIFT\_DIR and SHIFT\_NUM\_BITS if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to color-space-converted and stored in a different RGB format by setting the READ\_MODE\_OUTPUT\_IN\_RGB\_FORMAT field accordingly.
10. Set the WORD\_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if READ\_MODE\_OUTPUT\_IN\_RGB\_FORMAT is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF\_CTRL register.
11. Set the READ\_MODE\_NUM\_PACKED\_SUBWORDS field in LCDIF\_CTRL2 according to the number of subwords per word required to be packed.
12. Set the READ\_PACK\_DIR to 1 if it is required to store the data in big-endian format.
13. Set the LCD\_DATABUS\_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

## 21.4.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the eLCDIF and the external display at modest data rates.

Bus master or PIO transactions using the LCDIF\_DATA register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. eLCDIF can support the 6800 as well as the 8080 MPU protocol. If DOTCLK\_MODE, DVI\_MODE and VSYNC\_MODE bits in LCDIF\_CTRL registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in DISPLAY\_CLK cycles. The LCD\_WR signal is used as the write strobe while LCD\_RS signal is typically used to switch between command and data modes.

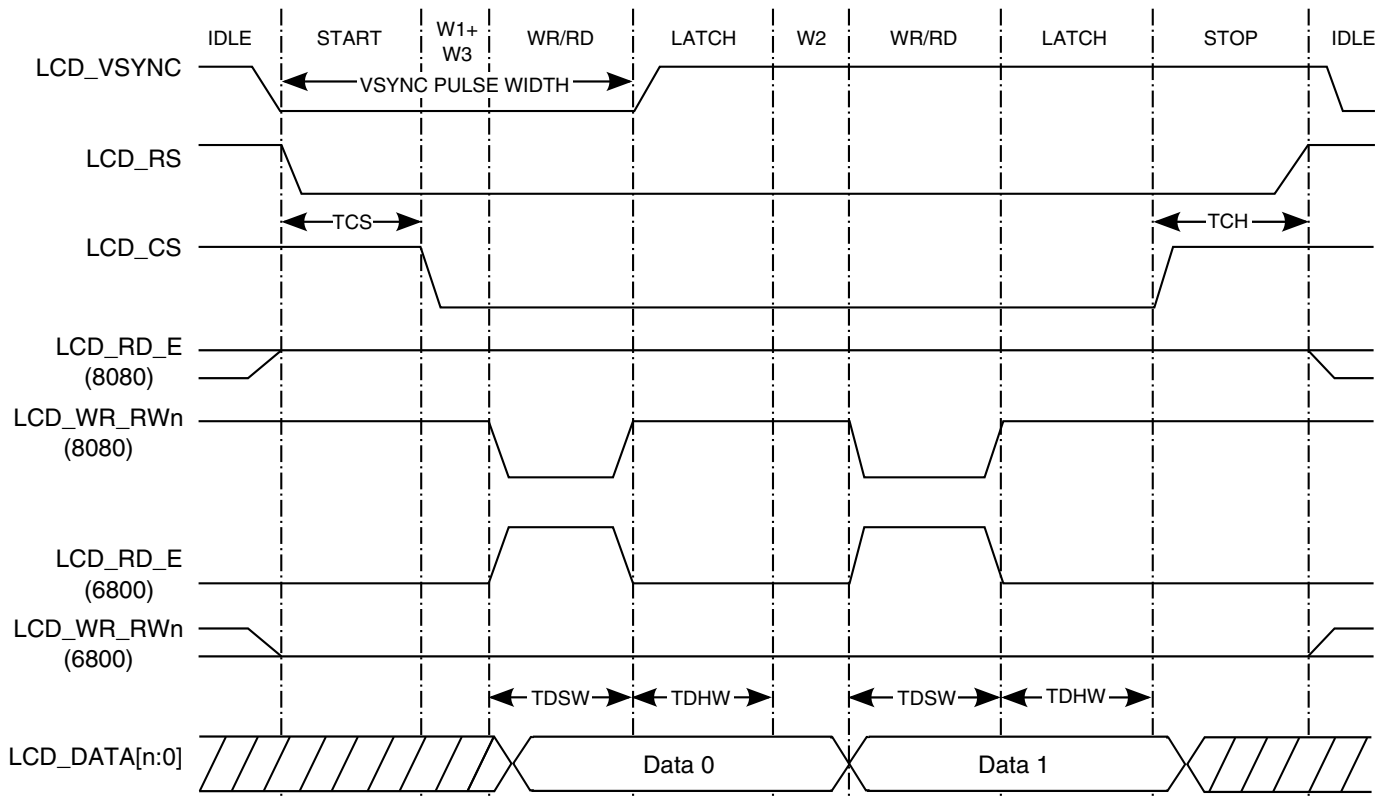

Figure 21-11. Timing in write mode of 6800 and 8080 protocols

Figure 21-12. Read timing interface in 6800 and 8080 protocols

The eLCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY\_CLK cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY\_CLK is 24 MHz. TDS and TDH are 8-bit values, so the minimum eLCDIF period is 510 DISPLAY\_CLK cycles (47 KHz with a 24 MHz DISPLAY\_CLK). The timings are not automatically adjusted if the DISPLAY\_CLK frequency changes, so it may be necessary to adjust the timings if DISPLAY\_CLK changes.

In the MPU interface mode, the LCDIF\_CTRL\_BYPASS\_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF\_TRANSFER\_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

### 21.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
// idle state for LCD_RS signal is high, regardless of the
// programming of the DATA_SELECT register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1); //Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
based
// on DISPLAY_CLK frequency and timing requirements of
controller.
// Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF\_DATA register. Note that when using the PIO write operations to the LCDIF\_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the eLCDIF data buffers. When eLCDIF is done transmitting H\_COUNT x V\_COUNT pixels, it will stop, turn off the RUN bit and assert the cur\_frame\_done interrupt.

### 21.4.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC\_MODE bit in LCDIF\_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC\_OEB bit in LCDIF\_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by eLCDIF. The timing of the VSYNC signal is based on the DISPLAY\_CLK (make sure VSYNC\_PULSE\_WIDTH\_UNIT = VSYNC\_PERIOD\_UNIT = 0 and VSYNC\_ONLY = 1) and it is determined by the VSYNC\_PERIOD, VSYNC\_PULSE\_WIDTH and VSYNC\_POL fields in LCDIF\_VDCTRL0-4 registers. The SYNC\_SIGNALS\_ON bit in LCDIF\_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by eLCDIF. If the WAIT\_FOR\_VSYNC\_EDGE bit in LCDIF\_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERTICAL\_WAIT\_CNT indicates the number of DISPLAY\_CLK cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF\_CTRL\_BYPASS\_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF\_TRANSFER\_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

### 21.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
//based on DISPLAY_CLK frequency and timing requirements of controller. Note that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC PULSE WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100); //Frame display rate in
//terms of number of DISPLAY_CLKs.
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
```

## Functional Description

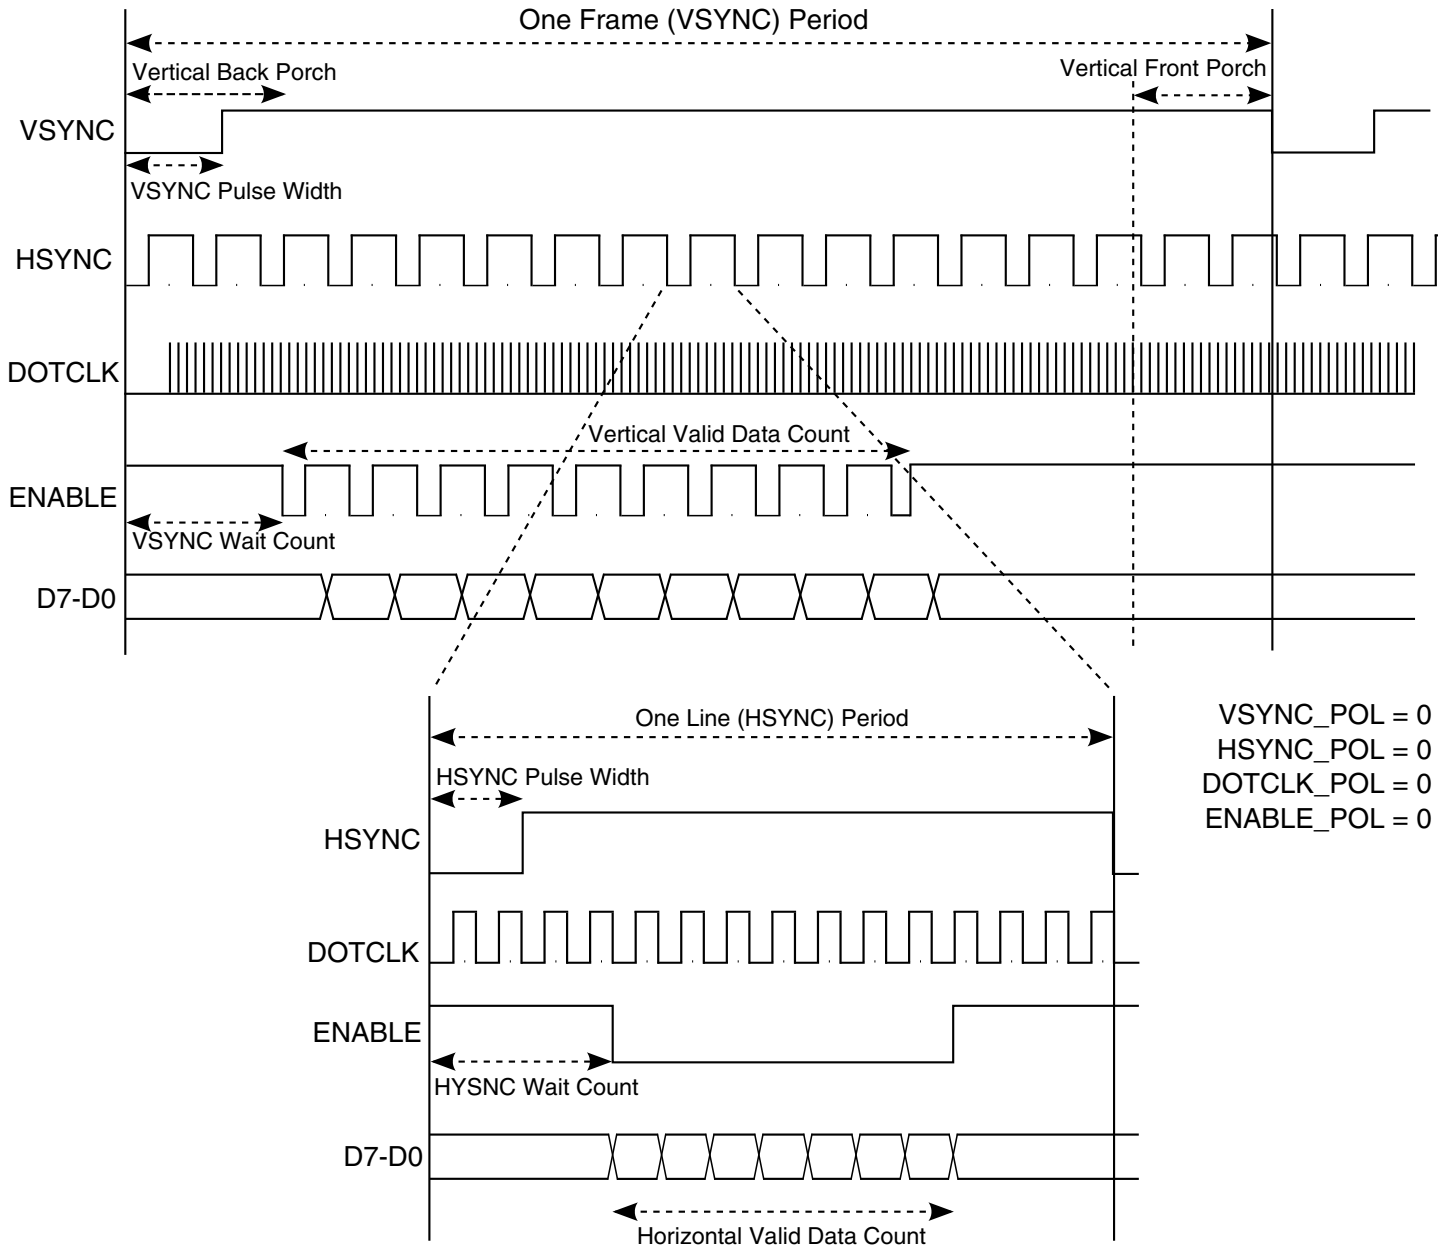

```
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if
//software wishes to transfer the next frame after the VSYNC edge occurs.
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF\_DATA register. When eLCDIF is done transmitting H\_COUNT x V\_COUNT pixels, it will stop, turn off the RUN bit and assert the cur\_frame\_done interrupt.

## 21.4.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

**Figure 21-13. DOTCLK protocol with programmable parameters**

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF\_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC\_PULSE\_WIDTH\_UNIT and VSYNC\_PERIOD\_UNIT bit fields. The VERTICAL\_WAIT\_CNT is by default given the same unit as the VSYNC\_PERIOD. The DISPLAY\_CLK frequency is managed by the CCM.

In DOTCLK mode, LCDIF\_CTRL\_BYPASS\_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK\_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur\_frame\_done interrupt.

### 21.4.8.1 Code Example

The following code shows an example for programming a 320x240 display. Note that setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
// LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320); //Note that DOTCLK_V_VALID_DATA_CNT is
//implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK\_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

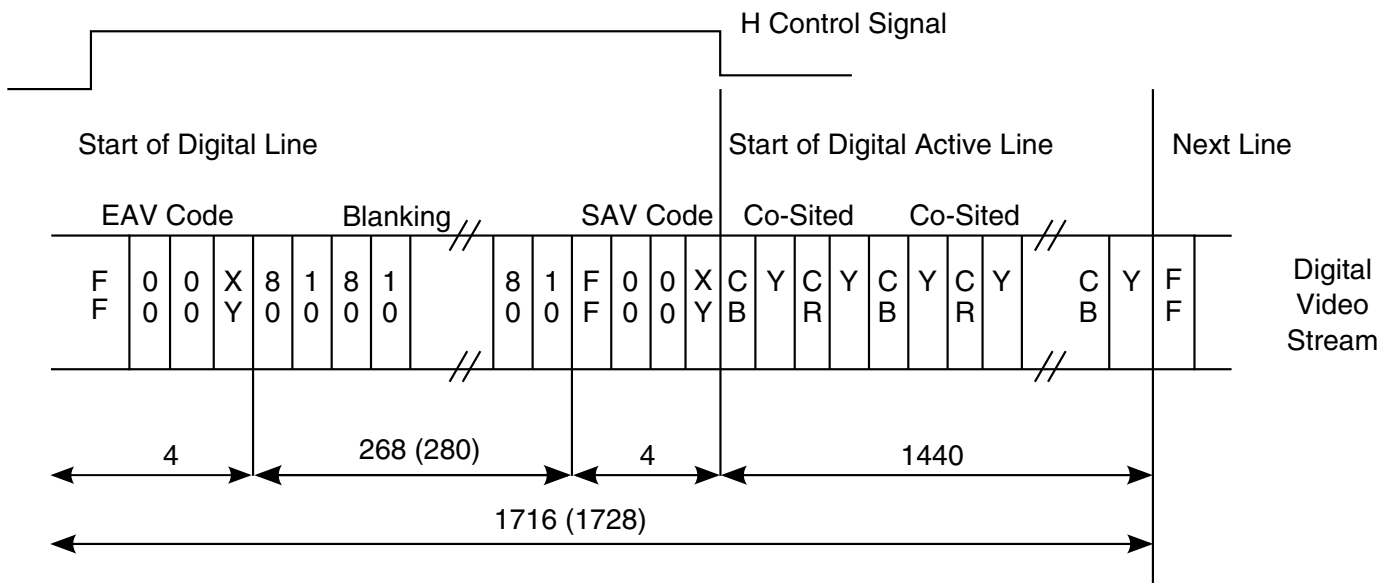

### 21.4.9 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD\_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD\_DOTCK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF\_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and

so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in [Initializing the eLCDIF](#) such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF\_CTRL\_BYPASS\_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI\_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur\_frame\_done interrupt.

**Figure 21-14. Digital Video Interface**

### 21.4.10 eLCDIF Pin Usage by Interface Mode

[Table 21-3](#) and [Table 21-4](#) indicates how the eLCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired eLCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD\_BUSY and LCD\_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

#### NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX\_SYNC\_SIGNALS bit in the VDCTRL0 register. There

is also an option to internally mux the LCD\_WR\_RWn and LCD\_RD\_E pins in the CTRL1 register for backward compatibility.

## 21.5 Behavior During Reset

BUS\_CLK and DISPLAY\_CLK must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

## 21.6 ELCDIF Memory Map/Register Definition

### eLCDIF Hardware Register Format Summary

## 21.6.1 eLCDIF General Control Register (LCDIF\_CTRLn)

The LCD Interface Control Register provides overall control of the eLCDIF block. The eLCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 20F\_8000h base + 0h offset + (4d × i), where i=0d to 3d

### LCDIF\_CTRLn field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the eLCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YCBCR422_INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the eLCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.

Table continues on the next page...

## LCDIF\_CTRLn field descriptions (continued)

Field	Description
28 READ_WRITEB	By default, eLCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data.  0x0 <b>TXDATA_SHIFT_LEFT</b> — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 <b>TXDATA_SHIFT_RIGHT</b> — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_COUNT	When this bit is 0, it means that eLCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the eLCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0.  0x0 <b>CMD_MODE</b> — Command Mode. DCn signal is Low. 0x1 <b>DATA_MODE</b> — Data Mode. DCn signal is High.
15–14 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are:  0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x0 <b>LITTLE_ENDIAN</b> — Little Endian byte ordering (same as NO_SWAP). 0x1 <b>BIG_ENDIAN_SWAP</b> — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 <b>SWAP_ALL_BYTES</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
13–12 CSC_DATA_SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are:  0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian)

Table continues on the next page...

## LCDIF\_CTRLn field descriptions (continued)

Field	Description
	0x0 <b>LITTLE_ENDIAN</b> — Little Endian byte ordering (same as NO_SWAP). 0x1 <b>BIG_ENDIAN_SWAP</b> — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 <b>SWAP_ALL_BYTES</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
11–10 LCD_DATABUS_WIDTH	LCD Data bus transfer width. 0x0 <b>16_BIT</b> — 16-bit data bus mode. 0x1 <b>8_BIT</b> — 8-bit data bus mode. 0x2 <b>18_BIT</b> — 18-bit data bus mode. 0x3 <b>24_BIT</b> — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 <b>16_BIT</b> — Input data is 16 bits per pixel. 0x1 <b>8_BIT</b> — Input data is 8 bits wide. 0x2 <b>18_BIT</b> — Input data is 18 bits per pixel. 0x3 <b>24_BIT</b> — Input data is 24 bits per pixel.
7 RGB_TO_YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 ENABLE_PXP_HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the eLCDIF will act as bus master and the handshake mechanism between eLCDIF and ePXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the eLCDIF act as a bus master. If this bit is reset, the eLCDIF will support or PIO mode.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_FORMAT_16_BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit is a don't care.
2 DATA_FORMAT_18_BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 <b>LOWER_18_BITS_VALID</b> — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 <b>UPPER_18_BITS_VALID</b> — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_FORMAT_24_BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 <b>ALL_24_BITS_VALID</b> — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 <b>DROP_UPPER_2_BITS_PER_BYTE</b> — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the eLCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

## 21.6.2 eLCDIF General Control1 Register (LCDIF\_CTRL1n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control1 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 20F\_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**LCDIF\_CTRL1n field descriptions**

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the eLCDIF master mode.
25 BM_ERROR_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the eLCDIF is in master mode and an error response was returned by the slave.

*Table continues on the next page...*

## LCDIF\_CTRL1n field descriptions (continued)

Field	Description
	0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the eLCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the eLCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the eLCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set. This feature is only available in DOTCLK and DVI modes.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have to be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. (Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
10 UNDERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.

Table continues on the next page...

## LCDIF\_CTRL1n field descriptions (continued)

Field	Description
	0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
9 CUR_FRAME_DONE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
8 VSYNC_EDGE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the eLCDIF from sending more data until ready). Otherwise this bit should be cleared.  0x0 <b>BUSY_DISABLED</b> — The busy signal from the LCD controller will be ignored. 0x1 <b>BUSY_ENABLED</b> — Enable the use of the busy signal from the LCD controller.
1 MODE86	This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0.  0x0 <b>8080_MODE</b> — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 <b>6800_MODE</b> — Pins LCD_WR_RWn and LCD_RD_E function as Read/Writeb and active high Enable signals respectively.
0 RESET	Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST.  0x0 <b>LCDRESET_LOW</b> — LCD_RESET output signal is low. 0x1 <b>LCDRESET_HIGH</b> — LCD_RESET output signal is high.

### 21.6.3 eLCDIF General Control2 Register (LCDIF\_CTRL2n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control2 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: 20F\_8000h base + 20h offset + (4d × i), where i=0d to 3d

### LCDIF\_CTRL2n field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that eLCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions.  0x0 <b>REQ_1</b> — 0x1 <b>REQ_2</b> — 0x2 <b>REQ_4</b> — 0x3 <b>REQ_8</b> — 0x4 <b>REQ_16</b> —
20 BURST_LEN_8	By default, when the eLCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,...). This bitfield must be 0 in DVI mode.  0x0 <b>RGB</b> — 0x1 <b>RBG</b> — 0x2 <b>GBR</b> — 0x3 <b>GRB</b> —

Table continues on the next page...

## LCDIF\_CTRL2n field descriptions (continued)

Field	Description
	0x4 <b>BRG</b> — 0x5 <b>BGR</b> —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,...). This bitfield must be 0 in DVI mode.  0x0 <b>RGB</b> — 0x1 <b>RBG</b> — 0x2 <b>GBR</b> — 0x3 <b>GRB</b> — 0x4 <b>BRG</b> — 0x5 <b>BGR</b> —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the eLCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. eLCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to eLCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8,16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.
3–1 INITIAL_DUMMY_ READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

### 21.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF\_TRANSFER\_COUNT)

This register tells the eLCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V\_COUNT and H\_COUNT fields. The word size is specified by the WORD\_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V\_COUNT and H\_COUNT should be non-zero.

Address: 20F\_8000h base + 30h offset = 20F\_8030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	V_COUNT																H_COUNT															
W	V_COUNT																H_COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### LCDIF\_TRANSFER\_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
15–0 H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

### 21.6.5 LCD Interface Current Buffer Address Register (LCDIF\_CUR\_BUF)

This register indicates the address of the current frame being transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur\_frame\_done interrupt for software to take action. The block will also copy the LCDIF\_NEXT\_BUF\_ADDR into this bitfield so that the software can program the next frame address into the LCDIF\_NEXT\_BUF\_ADDR bitfield. This address must always be double-word aligned.

## ELCDIF Memory Map/Register Definition

Address: 20F\_8000h base + 40h offset = 20F\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 21.6.6 LCD Interface Next Buffer Address Register (LCDIF\_NEXT\_BUF)

This register indicates the address of next frame that will be transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the eLCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the eLCDIF. This address must always be double-word aligned.

Address: 20F\_8000h base + 50h offset = 20F\_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 21.6.7 LCD Interface Timing Register (LCDIF\_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the CLK\_DIS\_LCDIFn frequency changes--it

may be necessary to adjust the timings if CLK\_DIS\_LCDIFn changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: 20F\_8000h base + 60h offset = 20F\_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### LCDIF\_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of CLK_DIS_LCDIFn cycles that the DCn signal is active after CEn is deasserted.
23–16 CMD_SETUP	Number of CLK_DIS_LCDIFn cycles that the the DCn signal is active before CEn is asserted.
15–8 DATA_HOLD	Data bus hold time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is de-asserted in a cycle
7–0 DATA_SETUP	Data bus setup time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is asserted in a cycle.

## 21.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF\_VDCTRL0n)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: 20F\_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ELCDIF Memory Map/Register Definition

### LCDIF\_VDCTRL0n field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode.  0x0 <b>VSYNC_OUTPUT</b> — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the eLCDIF block. 0x1 <b>VSYNC_INPUT</b> — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines. CLK_DIS_LCDIFn cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
17–0 VSYNC_PULSE_WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of CLK_DIS_LCDIFn cycles only.

### 21.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF\_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 20F\_8000h base + 80h offset = 20F\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	VSYNC_PERIOD																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### LCDIF\_VDCTRL1 field descriptions

Field	Description
31–0 VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

### 21.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF\_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 20F\_8000h base + 90h offset = 20F\_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	HSYNC_PULSE_WIDTH																HSYNC_PERIOD															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### LCDIF\_VDCTRL2 field descriptions

Field	Description
31–18 HSYNC_PULSE_WIDTH	Number of CLK_DIS_LCDIFn cycles for which HSYNC signal is active.
17–0 HSYNC_PERIOD	Total number of CLK_DIS_LCDIFn cycles between two positive or two negative edges of the HSYNC signal.

## 21.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF\_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 20F\_8000h base + A0h offset = 20F\_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved				MUX_SYNC_SIGNALS	VSYNC_ONLY	HORIZONTAL_WAIT_CNT									
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	VERTICAL_WAIT_CNT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### LCDIF\_VDCTRL3 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the eLCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatability with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
15–0 VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of CLK_DIS_LCDIFn cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the veritcal back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

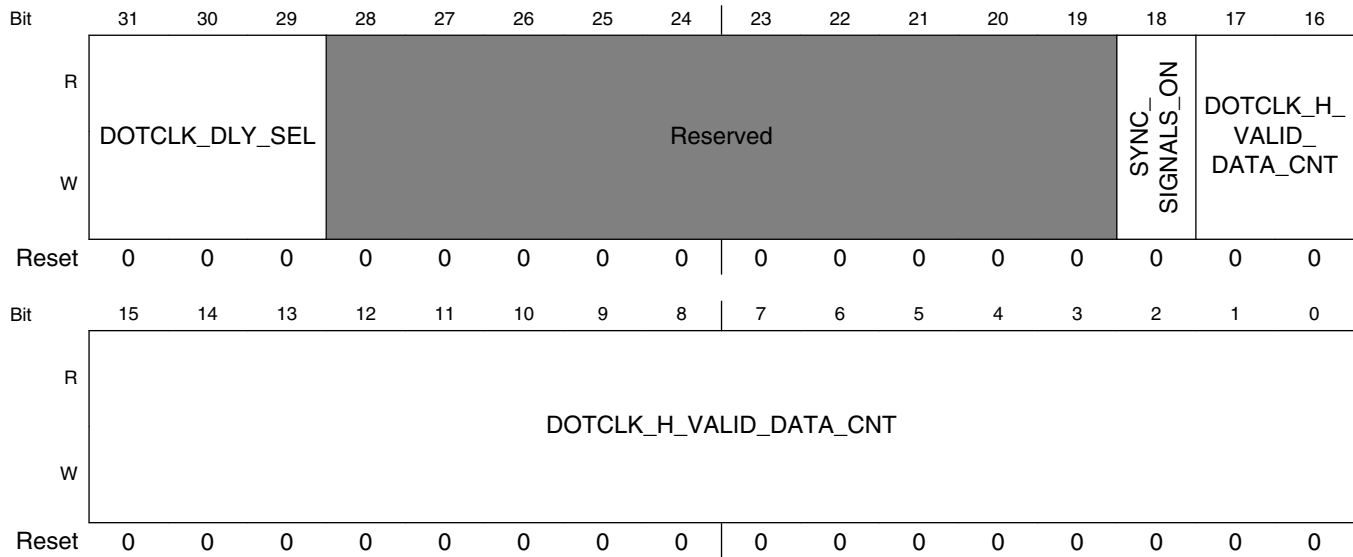

## 21.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF\_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode.

Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V\_COUNT bitfield in the LCDIF\_TRANSFER\_COUNT register.

Address: 20F\_8000h base + B0h offset = 20F\_80B0h

### LCDIF\_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_ SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active atleast one frame before the data transfers actually start and remain active atleast one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
17–0 DOTCLK_H_ VALID_DATA_ CNT	Total number of CLK_DIS_LCDIFn cycles on each horizontal line that carry valid data in DOTCLK mode.

### 21.6.13 Digital Video Interface Control0 Register (LCDIF\_DVICTRL0)

The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

#### EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x106); //262
//625/50 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x112); //274
```

Address: 20F\_8000h base + C0h offset = 20F\_80C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	Reserved				H_ACTIVE_CNT												Reserved				H_BLANKING_CNT											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### LCDIF\_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
11–0 H_BLANKING_CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

### 21.6.14 Digital Video Interface Control1 Register (LCDIF\_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

**EXAMPLE**

```
//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4); //4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109); //265
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x10A); //266
//625/50 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x138); //312
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x139); //313
```

Address: 20F\_8000h base + D0h offset = 20F\_80D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved		F1_START_LINE										F1_END_LINE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	F1_END_LINE						F2_START_LINE									
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**LCDIF\_DVICTRL1 field descriptions**

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
9–0 F2_START_LINE	Vertical line number from which Field 2 begins.

**21.6.15 Digital Video Interface Control2 Register (LCDIF\_DVICTRL2)**

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

**EXAMPLE**

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3); //3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108); //264
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x11A); //282
//625/50 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x271); //625
```

## ELCDIF Memory Map/Register Definition

```
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x137); //311
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x14F); //335
```

Address: 20F\_8000h base + E0h offset = 20F\_80E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved			F2_END_LINE										V1_BLANK_START_LINE		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	V1_BLANK_START_LINE							V1_BLANK_END_LINE								
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### LCDIF\_DVICTRL2 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
9–0 V1_BLANK_END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

## 21.6.16 Digital Video Interface Control3 Register (LCDIF\_DVICTRL3)

The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

### EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13); //19
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x20D); //525
//625/50 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x270); //624
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x16); //22
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x271); //625
```

Address: 20F\_8000h base + F0h offset = 20F\_80F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	Reserved			V2_BLANK_START_LINE										V2_BLANK_END_LINE			
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	V2_BLANK_END_LINE							V_LINES_CNT								
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**LCDIF\_DVICTRL3 field descriptions**

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 V2_BLANK_START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
9–0 V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

**21.6.17 Digital Video Interface Control4 Register (LCDIF\_DVICTRL4)**

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

**EXAMPLE**

```
//If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50); //80
HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10); //16
HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80); //128
HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80); //128
```

Address: 20F\_8000h base + 100h offset = 20F\_8100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Y_FILL_VALUE								CB_FILL_VALUE								CR_FILL_VALUE								H_FILL_CNT							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**LCDIF\_DVICTRL4 field descriptions**

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
7–0 H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

**21.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF\_CSC\_COEFF0)**

LCDIF\_CSC\_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

**EXAMPLE**

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41); // 0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3);
```

Address: 20F\_8000h base + 110h offset = 20F\_8110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved							C0								
W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	Reserved															CSC_ SUBSAMPL E_FILTER	
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**LCDIF\_CSC\_COEFF0 field descriptions**

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y

Table continues on the next page...

**LCDIF\_CSC\_COEFF0 field descriptions (continued)**

Field	Description
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.
1–0 CSC_ SUBSAMPLE_ FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr.  0x0 <b>SAMPLE_AND_HOLD</b> — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1.  0x1 <b>RSRVD</b> — Reserved  0x2 <b>INTERSTITIAL</b> — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples.  0x3 <b>COSITED</b> — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

**21.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF\_CSC\_COEFF1)**

LCDIF\_CSC\_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

**EXAMPLE**

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81) ; // 0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19) ; // 0.098x256=25
```

Address: 20F\_8000h base + 120h offset = 20F\_8120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**LCDIF\_CSC\_COEFF1 field descriptions**

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y

*Table continues on the next page...*

**LCDIF\_CSC\_COEFF1 field descriptions (continued)**

Field	Description
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
9–0 C1	Two's complement green multiplier coefficient for Y

**21.6.20 RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF\_CSC\_COEFF2)**

LCDIF\_CSC\_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

**EXAMPLE**

```
HW_LCDIF_CSC_COEFF2_C3_WR(0x3DB); // -0.148x256 = -37
HW_LCDIF_CSC_COEFF2_C4_WR(0x3B6); // -0.291x256 = -74
```

Address: 20F\_8000h base + 130h offset = 20F\_8130h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved						C4										Reserved						C3									
W	Reserved						C4										Reserved						C3

**LCDIF\_CSC\_COEFF2 field descriptions**

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C4	Two's complement green multiplier coefficient for Cb
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
9–0 C3	Two's complement red multiplier coefficient for Cb

### 21.6.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF\_CSC\_COEFF3)

LCDIF\_CSC\_COEFF3 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

#### EXAMPLE

```
HW_LCDIF_CSC_COEFF3_C5_WR(0x70); //0.439x256=112
HW_LCDIF_CSC_COEFF3_C6_WR(0x70); //0.439x256=112
```

Address: 20F\_8000h base + 140h offset = 20F\_8140h

#### LCDIF\_CSC\_COEFF3 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C6	Two's complement red multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
9–0 C5	Two's complement blue multiplier coefficient for Cb

### 21.6.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF\_CSC\_COEFF4)

LCDIF\_CSC\_COEFF4 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

#### EXAMPLE

```
HW_LCDIF_CSC_COEFF4_C7_WR(0x3A2); //-0.368x256=-94
HW_LCDIF_CSC_COEFF4_C8_WR(0x3EE); //-0.071x256=-18
```

Address: 20F\_8000h base + 150h offset = 20F\_8150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	Reserved						C8										Reserved						C7									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## LCDIF\_CSC\_COEFF4 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C8	Two's complement blue multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
9–0 C7	Two's complement green multiplier coefficient for Cr

## 21.6.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF\_CSC\_OFFSET)

LCDIF\_CSC\_ register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0 \cdot R + C1 \cdot G + C2 \cdot B + Y\_offset$   
 $Cb = C3 \cdot R + C4 \cdot G + C5 \cdot B + CbCr\_offset$   
 $Cr = C6 \cdot R + C7 \cdot G + C8 \cdot B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

Address: 20F\_8000h base + 160h offset = 20F\_8160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								CBCR_OFFSET								Reserved								Y_OFFSET							
W	Reserved								CBCR_OFFSET								Reserved								Y_OFFSET							
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

## LCDIF\_CSC\_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

**LCDIF\_CSC\_OFFSET field descriptions (continued)**

Field	Description
8–0 Y_OFFSET	Two's complement offset for the Y component

**21.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF\_CSC\_LIMIT)**

LCDIF\_CSC\_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by:  $Y = C0*R + C1*G + C2*B + Y\_offset$   $Cb = C3*R + C4*G + C5*B + CbCr\_offset$   $Cr = C6*R + C7*G + C8*B + CbCr\_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

**EXAMPLE**

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0); //240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB); //235
```

Address: 20F\_8000h base + 170h offset = 20F\_8170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**LCDIF\_CSC\_LIMIT field descriptions**

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
7–0 Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

## 21.6.25 LCD Interface Data Register (LCDIF\_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the ARM platform into LCDIF. This data then gets sent out by the block across the interface.

Address: 20F\_8000h base + 180h offset = 20F\_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W

### LCDIF\_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to eLCDIF.
15–8 DATA_ONE	Byte 1 of data written to eLCDIF.
7–0 DATA_ZERO	Byte 0 (least significant byte) of data written to eLCDIF.

## 21.6.26 Bus Master Error Status Register (LCDIF\_BM\_ERROR\_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM\_ERROR\_IRQ is asserted, the address of the bus error is updated in the register.

Address: 20F\_8000h base + 190h offset = 20F\_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W

**LCDIF\_BM\_ERROR\_STAT field descriptions**

Field	Description
31–0 ADDR	Virtual address at which bus master error occurred.

**21.6.27 CRC Status Register (LCDIF\_CRC\_STAT)**

This register reflects the CRC value of each frame sent out by eLCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD\_DATABUS\_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR\_FRAME\_DONE\_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

Address: 20F\_8000h base + 1A0h offset = 20F\_81A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**LCDIF\_CRC\_STAT field descriptions**

Field	Description
31–0 CRC_VALUE	Calculated CRC value.

**21.6.28 LCD Interface Status Register (LCDIF\_STAT)**

The LCD interface status register can be used to check the current status of the eLCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

ELCDIF Memory Map/Register Definition

Address: 20F\_8000h base + 1B0h offset = 20F\_81B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	Reserved								LFIFO_COUNT							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**LCDIF\_STAT field descriptions**

Field	Description
31 PRESENT	0: eLCDIF not present on this product 1: eLCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signal that indicates that LCD read datapath FIFO is full, will be generally used in the write mode of the LCD interface.
28 LFIFO_EMPTY	Read only view of the signal that indicates that LCD read datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
27 TXFIFO_FULL	Read only view of the signal that indicates that LCD write datapath FIFO is full, will be generally used in the write mode of the LCD interface.
26 TXFIFO_EMPTY	Read only view of the signal that indicates that LCD write datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23–9 RSRVD0	This field is reserved. Reserved bits. Write as 0.
8–0 LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

**21.6.29 LCD Interface Version Register (LCDIF\_VERSION)**

The LCD interface version register can be used to read the version of the eLCDIF IP being used in this SoC.

The LCD interface debug register is for diagnostic use only.

Address: 20F\_8000h base + 1C0h offset = 20F\_81C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**LCDIF\_VERSION field descriptions**

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of RTL version.
15–0 STEP	Fixed read-only value reflecting the stepping of RTL version.

LCDIF\_VERSION field descriptions (continued)

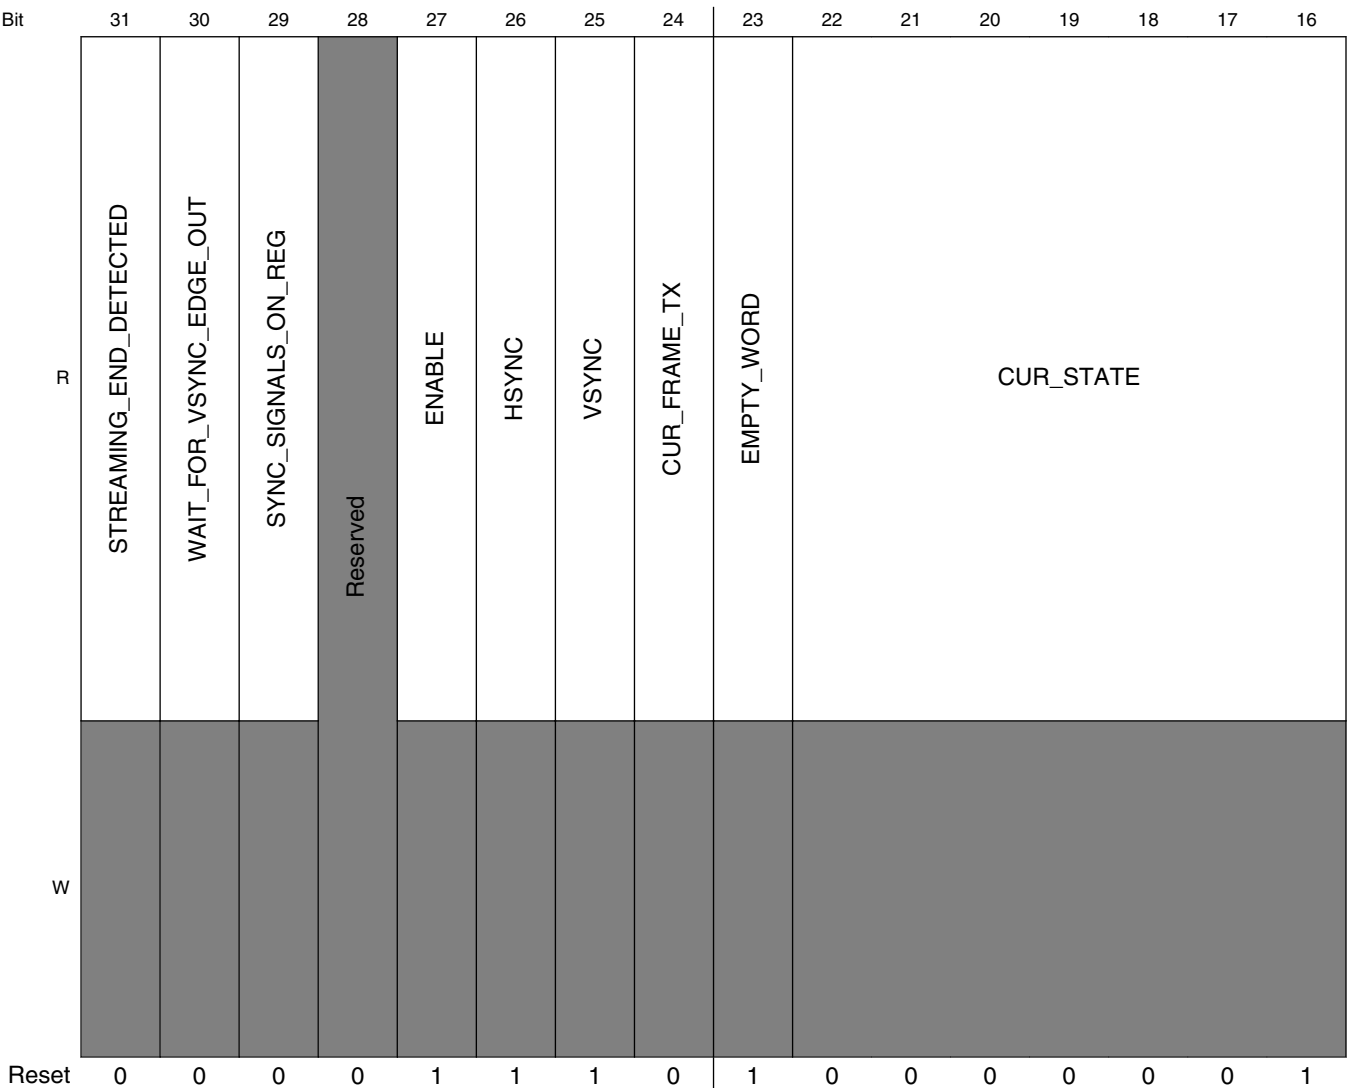

Field	Description
-------	-------------

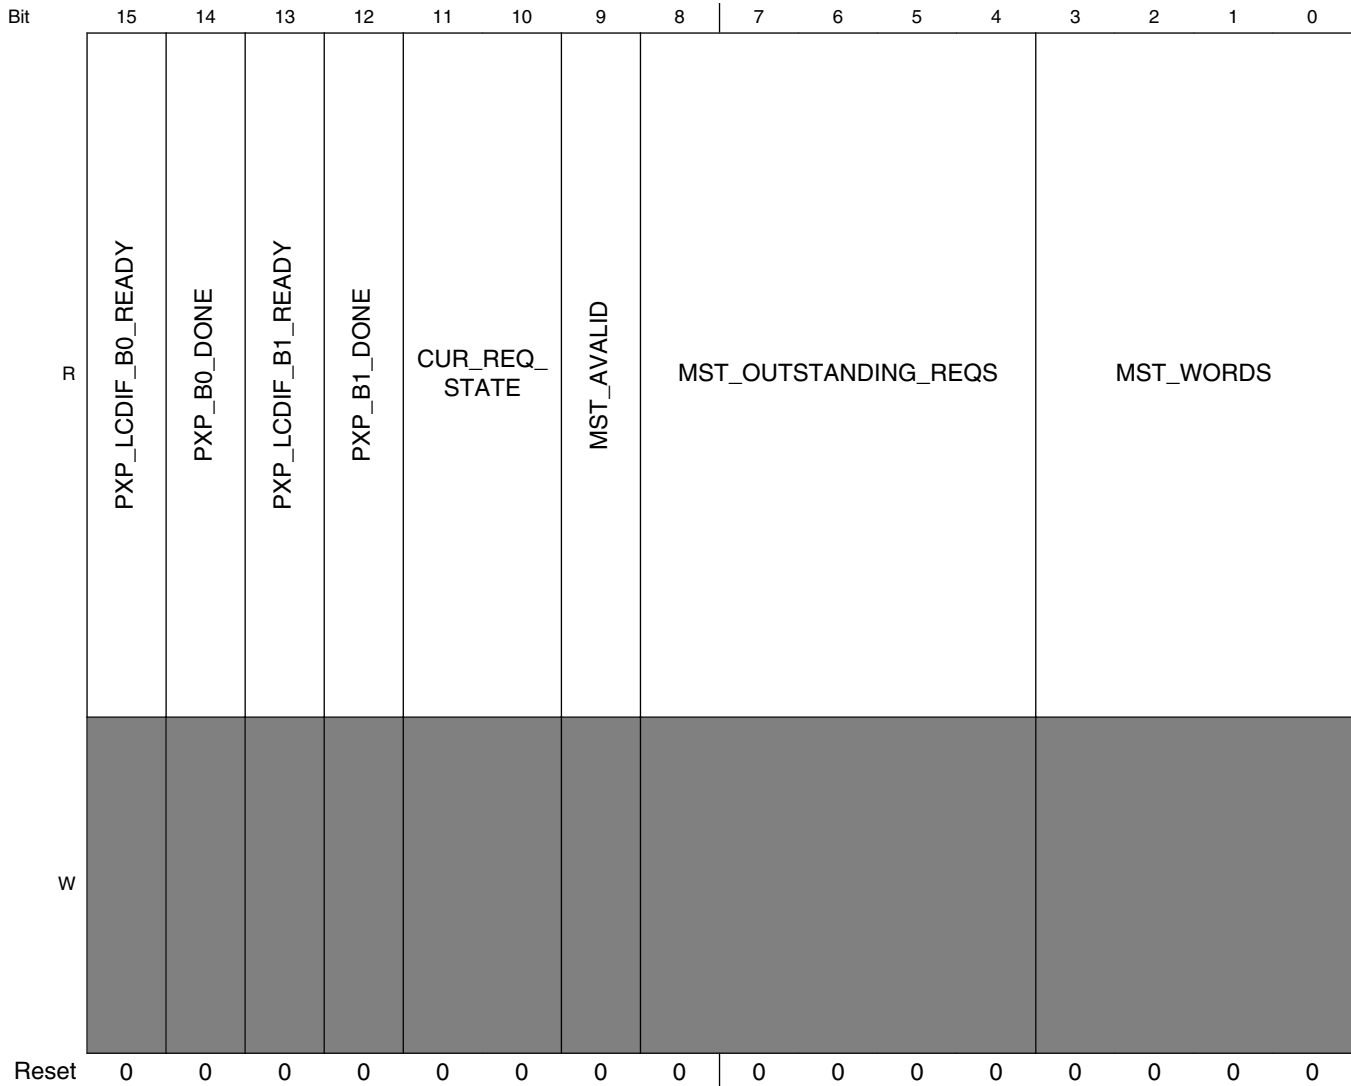

21.6.30 LCD Interface Debug0 Register (LCDIF\_DEBUG0)

The LCD interface debug0 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: 20F\_8000h base + 1D0h offset = 20F\_81D0h

LCDIF\_DEBUG0 field descriptions

Field	Description
31 STREAMING_ END_DETECTED	Read only view of the DOTCLK_MODE or DVI_MODE bit going from 1 to 0.
30 WAIT_FOR_ VSYNC_EDGE_ OUT	Read only view of WAIT_FOR_VSYNC_EDGE bit in the VSYNC mode after it comes out of the TXFIFO.
29 SYNC_SIGNALS_ ON_REG	Read only view of internal sync_signals_on_reg signal.
28 -	This field is reserved. Reserved.
27 ENABLE	Read only view of ENABLE signal.

Table continues on the next page...

**LCDIF\_DEBUG0 field descriptions (continued)**

Field	Description
26 HSYNC	Read only view of HSYNC signal.
25 VSYNC	Read only view of VSYNC signal.
24 CUR_FRAME_TX	This bit is 1 for the time the current frame is being transmitted in the VSYNC mode. Useful for VSYNC mode debug.
23 EMPTY_WORD	Indicates that the current word is empty.
22–16 CUR_STATE	Read only view of the current state machine state in the current mode of operation.
15 PXP_LCDIF_B0_READY	Buffer0 ready signal issued by ePXP.
14 PXP_B0_DONE	Buffer0 done signal issued by eLCDIF.
13 PXP_LCDIF_B1_READY	Buffer1 ready signal issued by ePXP.
12 PXP_B1_DONE	Buffer1 done signal issued by eLCDIF.
11–10 CUR_REQ_STATE	Read only view of the request state machine.
9 MST_AVALID	Read only view of the mst_avalid signal issued by the AXI bus master.
8–4 MST_OUTSTANDING_REQS	Read only view of the current outstanding requests issued by the AXI bus master.
3–0 MST_WORDS	Read only view of the current bursts issued by the AXI bus master.

**21.6.31 LCD Interface Debug1 Register (LCDIF\_DEBUG1)**

The LCD interface debug1 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: 20F\_8000h base + 1E0h offset = 20F\_81E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	H_DATA_COUNT																V_DATA_COUNT

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**LCDIF\_DEBUG1 field descriptions**

Field	Description
31–16 H_DATA_COUNT	Read only view of the current state of the horizontal data counter.
15–0 V_DATA_COUNT	Read only view of the current state of the vertical data counter.

**21.6.32 LCD Interface Debug2 Register (LCDIF\_DEBUG2)**

The LCD interface debug2 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: 20F\_8000h base + 1F0h offset = 20F\_81F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**LCDIF\_DEBUG2 field descriptions**

Field	Description
31–0 MST_ADDRESS	Read only view of the current address issued by the AXI bus master.

**21.6.33 eLCDIF Threshold Register (LCDIF\_THRES)**

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: 20F\_8000h base + 200h offset = 20F\_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved							FASTCLOCK								Reserved							PANIC									
W																																
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

**LCDIF\_THRES field descriptions**

<b>Field</b>	<b>Description</b>
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal/vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
8–0 PANIC	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the panic control output will be raised. This signal can be used to raise the access eLCDIF's access priority.

# Chapter 22

## Electrophoretic Display Controller (EPDC)

### 22.1 Overview

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

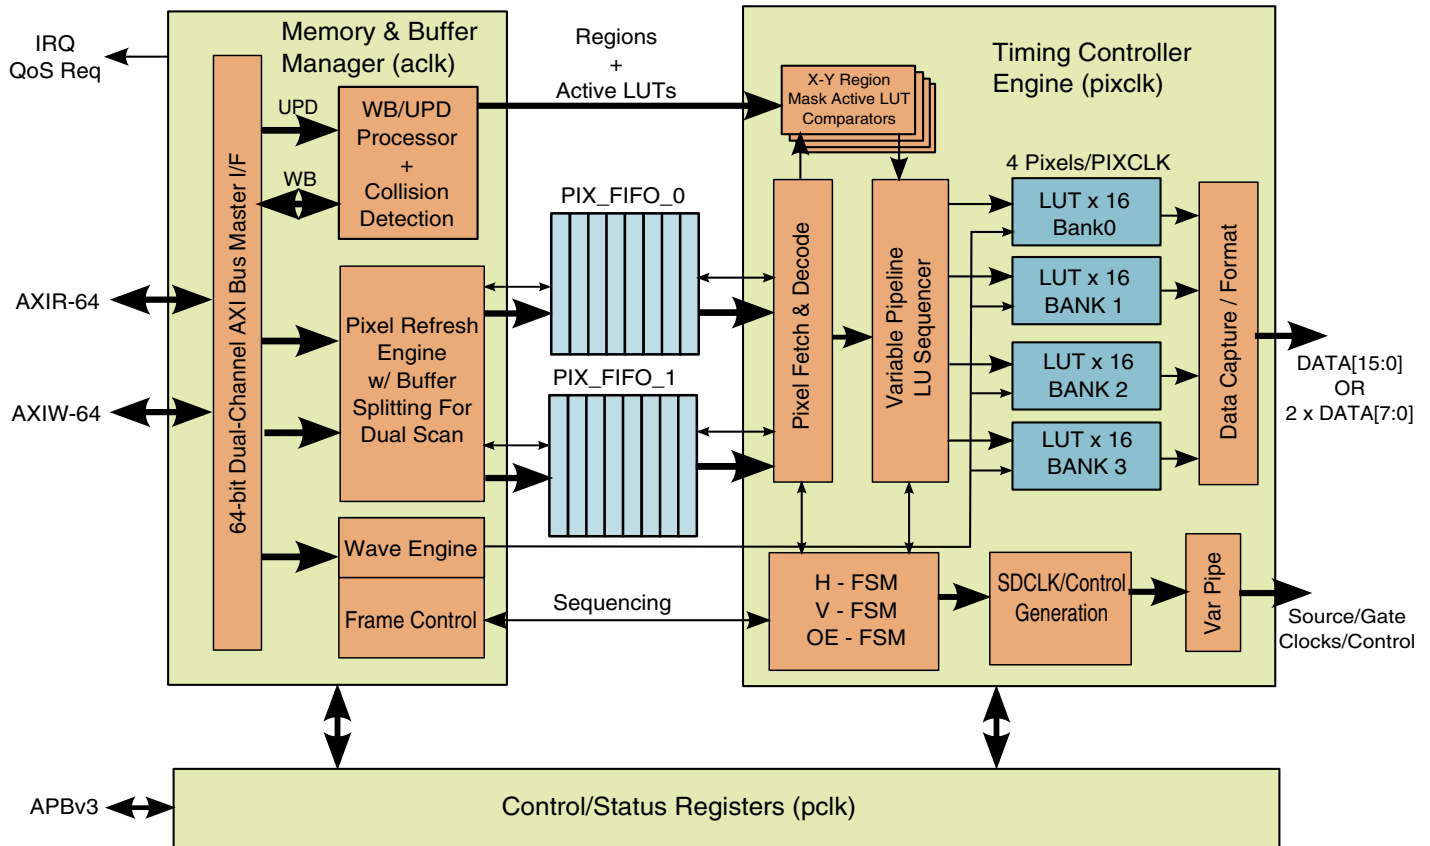

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Dual-scan TFT drive mode to support ultra high resolution/refresh rate displays
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking

- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan with multiple update requests
- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

### 22.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

**Figure 22-1. EPDC Top-Level Block Diagram**

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- **Memory and Buffer Manager (MBM):** This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *aclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *aclk* too.
- **Timing Control Engine (TCE):** This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

## 22.2 External Signals

The following table describes the external signals of EPDC:

**Table 22-1. EPDC External Signals**

Signal	Description	Pad	Mode	Direction
EPDC_BDR0	Panel-Border Control (SW controlled)	ECSPI1_MISO	ALT3	O
		EPDC_BDR0	ALT0	
EPDC_BDR1	Panel-Border Control (SW controlled)	ECSPI1_SS0	ALT3	O

## 22.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the eXPX IP) are described below.

### 22.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
- EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I<sup>2</sup>C and 4-wire power sequencing signals.
- Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
- Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

## 22.3.2 Register Space (Write/Set/Clear/Toggle)

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

### NOTE

Interrupt status bits (such as those contained in EPDC\_IRQ) must be cleared with the clear address only. Writing to the EPDC\_IRQ register with a 0 will not clear the interrupt status/source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

## 22.3.3 Interrupts

### 22.3.3.1 Interrupt Sources

The EPDC contains 72 ( 64 of LUT completes IRQs and 8 of common IRQs ) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC\_IRQ /EPDC\_IRQ1/EPDC\_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC\_IRQ\* register is set by the EPDC. Each of the bits in EPDC\_IRQ is first AND'ed with its enable bit (in EPDC\_IRQ\_MASK\*), and then the masked bits are logically OR'ed together to generate the final output.

### 22.3.3.2 Enabling/Masking Interrupts

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC\_IRQ\_MASK\* register.

Even if an interrupt source is masked out (IRQ\_EN bit set to 0), its status will still be available in the EPDC\_IRQ\* register. The difference is that it does not result in the interrupt line being asserted.

### 22.3.3.3 Handling/Clearing Interrupts

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC\_IRQ\* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB\_CMPLT\_IRQ and LUT\_COL\_IRQ fields of EPDC\_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see [Register Space \(Write/Set/Clear/Toggle\)](#) for details).

When collision has occurred and the LUT\_COL\_IRQ bit is set, SW will handle the collision and clear LUT\_COL\_IRQ. Please note HW will also clear the entire EPDC\_STATUS\_COL\* register at the sametime on LUT\_COL\_IRQ clearing by SW.

## 22.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

### 22.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC\_WB\_ADDR, must have EPDC\_RES[HORIZONTAL] x EPDC\_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
  - EPDC\_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC\_UPD\_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
  - a. when stride feature not enabled
    - EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_SIZE[WIDTH] bytes
    - Note that EPDC\_UPD\_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
  - b. when stride feature enabled
    - EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_STRIDE bytes
    - EPDC\_UPD\_SIZE[WIDTH] is used to reflect valid bytes in a line with EPDC\_UPD\_STRIDE pixels, STRIDE >= WIDTH
    - no alignment requirement on line start or end, no padding necessary unless STRIDE > WIDTH
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- WB-roundup4(EPDC\_RES[HORIZONTAL]) x EPDC\_RES[VERTICAL] x 2
- when stride feature not enabled: UPD-N x roundup8(EPDC\_UPD\_SIZE[WIDTH]) x EPDC\_UPD\_SIZE[HEIGHT]
  - N = the number of update requests currently being managed by the i.MX EPD driver (that is, the driver may maintain a list of updates in memory which it uses to feed the EPDC).
- when stride feature enabled: UPD-N x EPDC\_UPD\_STRIDE x EPDC\_UPD\_SIZE[HEIGHT]

## 22.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EPDC\_RES, EPDC\_FORMAT, EPDC\_TCE\_CTRL, EPDC\_TCE\_SDCFG and EPDC\_TCE\_GDCFG registers as follows.

- **EPDC\_RES:**
  - **HORIZONTAL:** The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS\_PER\_SDCLK value. It also must be an integer multiple of the PIXELS\_PER\_CE value.
  - **VERTICAL:** The panel vertical resolution (in pixels). This can be any integer value.
- **EPDC\_FORMAT:**
  - **DEFAULT\_TFT\_PIXEL:** This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution. This value must always correspond to the state the source driver should see when no voltage change is needed. Incorrectly setting this value will damage the EPD material.
  - **TFT\_PIXEL\_FORMAT:** This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.
- **EPDC\_TCE\_CTRL:**
  - **SDDO\_WIDTH:** This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO\_WIDTH would be set to 8-bit.

- **VCOM\_MODE, VCOM\_VAL:** This VCOM\_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM\_VAL field, for panels which support VCOM modulation.
- **DDR\_MODE:** This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR\_MODE = 1 and LVDS\_MODE = 0.
- **LVDS\_MODE:** This mode always requires DDR\_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS\_MODE\_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
- **LVDS\_MODE\_CE:** When LVDS\_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
- **DUAL\_SCAN:** Setting this field enables the dual scan function. When this field is set, all other parameters (except resolution) should be programmed in reference to each half of the panel. Because DUAL\_SCAN modes require 2x the pixel-generation capability, there are limitations to the available TFT modes supported in this configuration (see [Table 22-2](#) for details).
- **SCAN\_DIR0, SCAN\_DIR1:** These fields determine the vertical scan direction of the panel.
  - **SCAN\_DIR0:** Determines the vertical scan direction of the panel when DUAL\_SCAN = 0. When DUAL\_SCAN = 1, it determines the vertical scan direction of the top-half of the panel (0 means scan down and 1 means scan up).
  - **SCAN\_DIR1** only has meaning when DUAL\_SCAN = 1. It defines the vertical scan direction of the bottom half of the panel.
- **PIXELS\_PER\_SDCLK:** This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When DDR\_MODE = 1, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See [Table 22-2](#) for the required values per mode.
- **EPDC\_TCE\_SDCFG:**
  - **SDCLK\_HOLD:** Holds the SDCLK low during the LINE\_BEGIN time. The purpose of this field is to allow the user to set a LINE\_BEGIN time which is not an integer multiple of SDCLKs (for fine tuning the line-time).

- SDSHR: Defines the value of the SDSHR output signal which determines the source driver output order mapping.
- NUM\_CE: Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
- PIXELS\_PER\_CE: This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.
- SDDO\_REFORMAT: This enumerated field allows for TFT-pixel level reordering within DATA. For most panels it is recommended to set SDDO\_REFORMAT to the REVERSE\_PIXELS enumeration.
- SDDO\_INVERT: When this field is set, the values on DATA are inverted relative to the values extracted from the waveform LUT operations.
- EPDC\_TCE\_GDCFG:
  - GDRL: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
  - GDOE\_MODE: This field selects between two possible methods for driving the GDOE signal. When GDOE\_MODE = 0, the GDOE output is always driven during the frame scan time, except during FRAME\_SYNC when it is driven low. When GDOE\_MODE = 1, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
  - GDSP\_MODE: This field selects between two possible methods for driving the GDSP signal. When GDSP\_MODE = 0, the GDSP signal is driven on the first line clock time of the FRAME\_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP\_OFFSET control. When GDSP\_MODE = 1, GDSP is active during the entire FRAME\_SYNC time, and GDSP\_OFFSET has not effect in this mode.

### 22.3.4.3 TFT Panel Timing Configuration

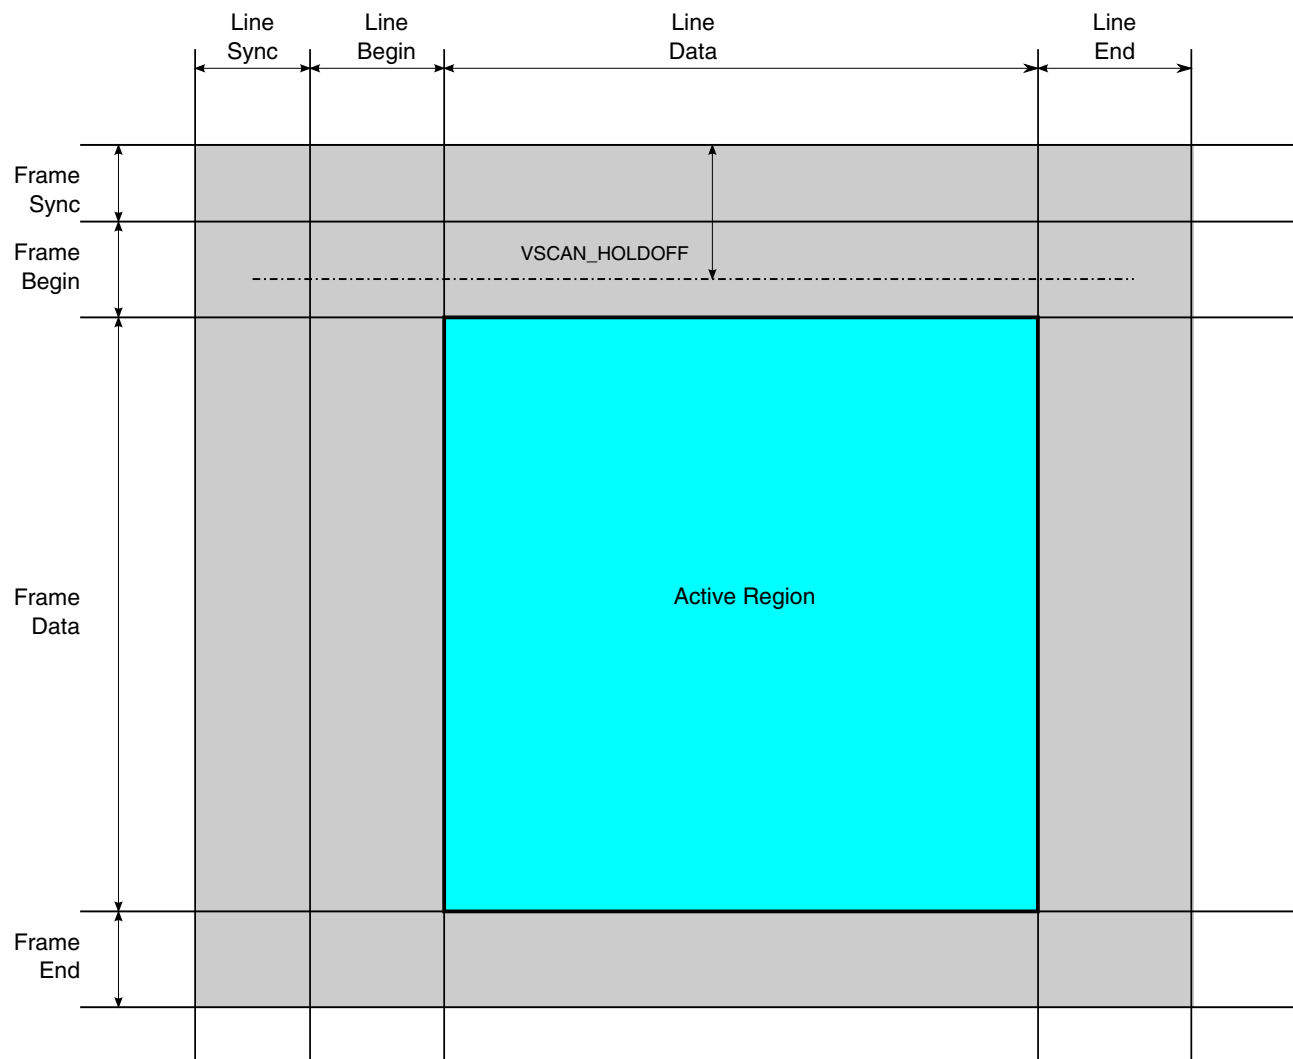

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.
- Arrive at a source driver clock frequency which in turn defines the exact pixel clock frequency. In most cases, E-INK<sup>TM</sup> provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

**Figure 22-2. Frame Timing**

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK (LS + LB + (HRES \times \left( \frac{\text{Ratio}}{\text{PIXELSPERSDCLK}} \right) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

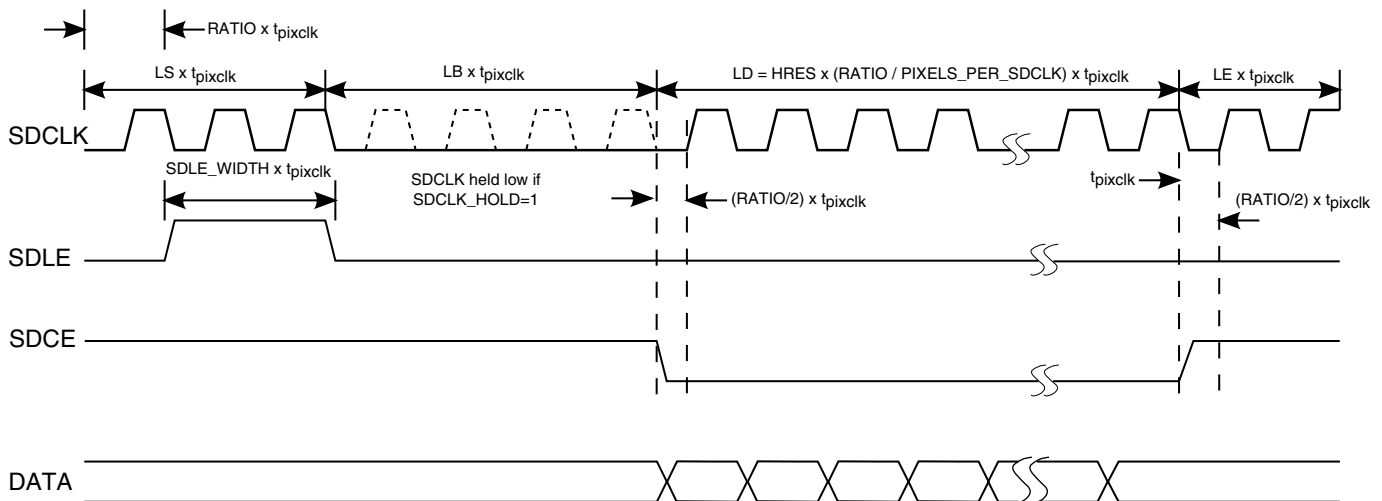

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to [Table 22-2](#). A simple method to determine the ratio is as follows:

- When  $\text{DDR\_MODE} = 1$ ,  $\text{RATIO} = 4$
- When  $\text{DDR\_MODE} = 0$ 
  - If  $\text{PIXELS\_PER\_SDCLK} = 8$ ,  $\text{RATIO} = 4$
  - Else,  $\text{RATIO} = 2$

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

The following figure shows line timing for cases, where  $\text{DDR\_MODE} = 0$  (those cases where data is only sampled by the source driver on the rising edge of SDCLK).

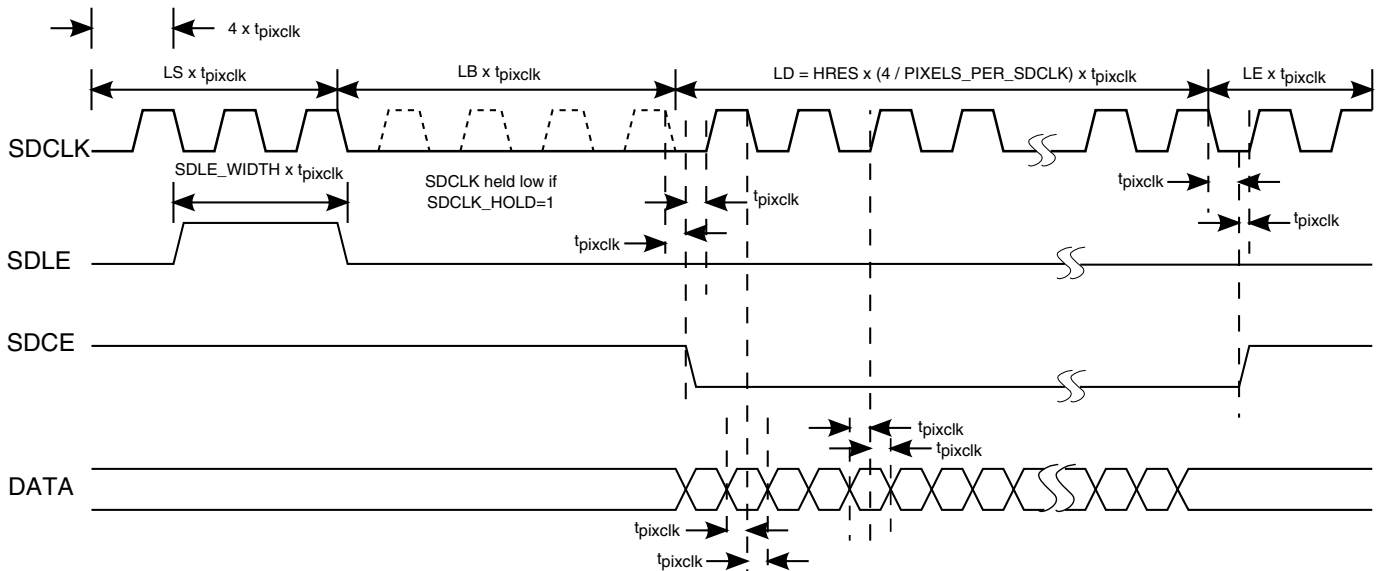

Depending on the mode (see [Table 22-2](#)), the ratio is a function of TFT pixel width and  $\text{PIXELS\_PER\_SDCLK}$ , so the timings are shown generically. For the purposes of this diagram,  $\text{RATIO}$  can either be 2 or 4.

**Figure 22-3. Line Timing ( $\text{DDR\_MODE} = 0$ )**

As per [Table 22-2](#), when  $\text{DDR\_MODE}=1$  (for example, for source drivers that require data to be driven on each edge of SDCLK), the  $\text{RATIO}$  is always set to 4. The timing for such cases is shown in the figure below.

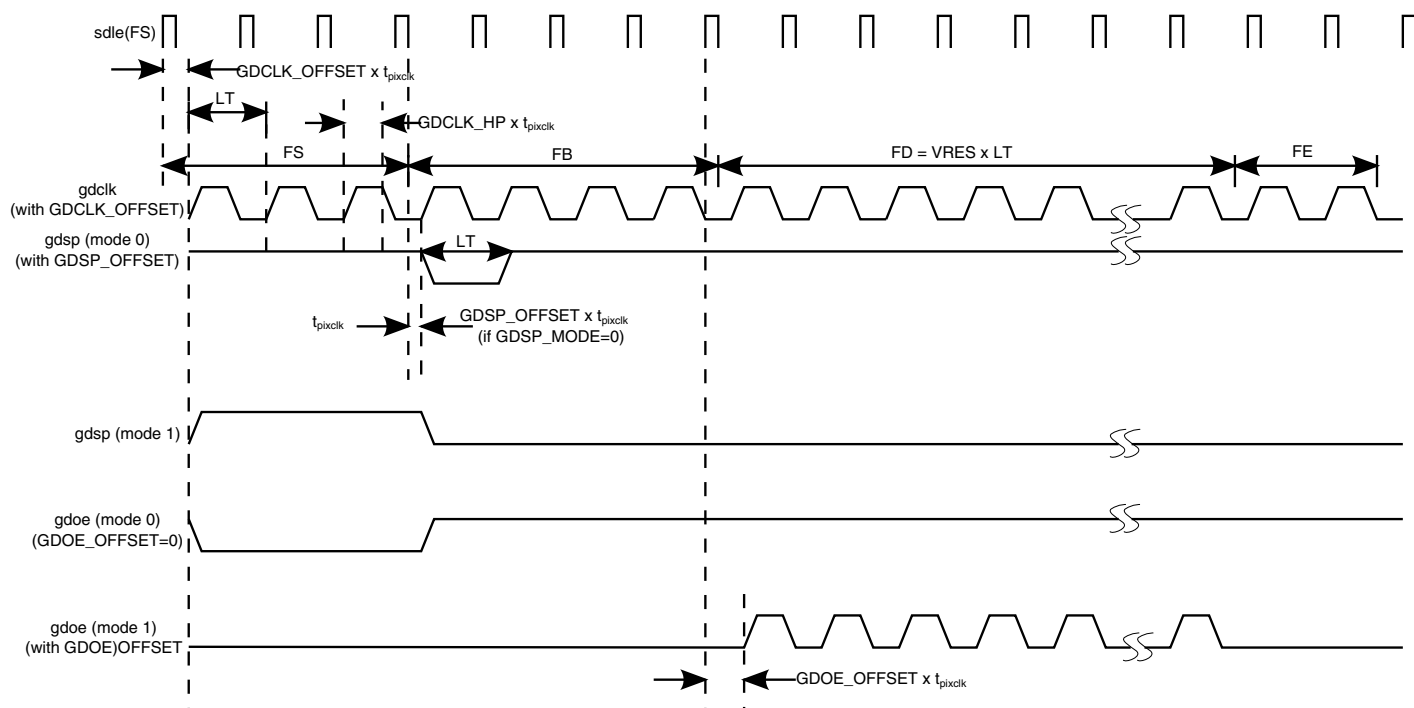

## Programming Model

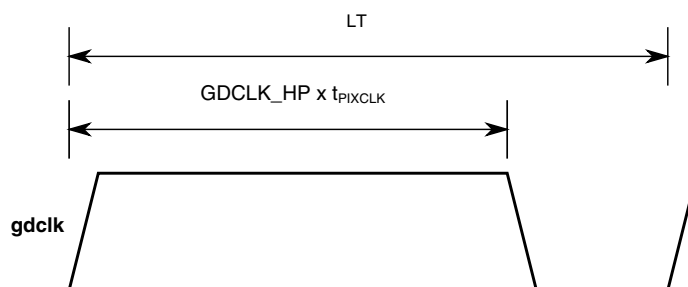

**Figure 22-4. Line Timing (DDR\_MODE = 1) - RATIO = 4**

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in [Figure 22-6](#). The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE\_SYNC leading edge (this includes GDCLK\_OFFSET, GDSP\_OFFSET, and GDOE\_OFFSET).
- GDSP\_OFFSET is only supported for GDSP\_MODE = 1
- For GDOE\_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE\_OFFSET value should be set at a value appropriately greater than GDCLK\_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE\_SYNC leading edge.
- The LINE\_SYNC leading edge doesn't depend on the LINE\_SYNC\_WIDTH value. In cases where LINE\_SYNC\_WIDTH is set to some value that is less than LINE\_SYNC, a virtual leading edge which determines the line start time still exists.

### Figure 22-5. Frame Timing (Vertical)

### Figure 22-6. GDCLK Duty Cycle

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown be:

- $\text{PIXELS\_PER\_SDCLK} = 4$
- $\text{Ratio} = 2$  (2 bpp, 8-bit single-ended, SDR per [Table 22-2](#))
- $\text{tPIXCLK} = 17.64 \text{ MHz}$  (assuming available chip clock frequency)
- $\text{LS} = 20 \times \text{tPIXCLK}$
- $\text{LB} = 8 \times \text{tPIXCLK}$
- $\text{LD} = 800 \times (2/4) \times \text{tPIXCLK} = 400 \times \text{tPIXCLK}$
- $\text{LE} = 142 \times \text{tPIXCLK}$
- $\text{LT} = (20 + 8 + 400 + 142) \times \text{tPIXCLK} = 32.31293 \text{ uS}$

LINE\_SYNC\_WIDTH does not affect line timing. It should be set to the same value as LINE\_SYNC, unless LB and LE are short and it is used to shorten the width of SDLE whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312 uS. Then the frame-rate can be calculated and given the vertical timings:

- $FS = 4 \times LT$
- $FB = 4 \times LT$
- $FD = 600 \times LT$
- $FE = 10 \times LT$
- $FT = (4 + 4 + 600 + 10) \times LT = 50.07665 \text{ Hz}$

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through `HW_EPDC_TCE_TIMING2[GDCLK_HP]`, or GDCLK High-Pulse time.

### 22.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC\_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

**Table 22-2. Interface Modes**

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
Single Scan	2bpp, 8-bit single-ended, SDR	0	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 16-bit single-ended, SDR	0	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
	2bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	2B[V]	EIGHT	110	1	8BIT	SDCLK x 4
	4bpp, 8-bit single-ended, SDR	0	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 16-bit, single-ended SDR	0	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2
	4bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	4B[V]	FOUR	110	1	8BIT	SDCLK x 4
	4bpp, 16-bit, single-ended, DDR	0	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4

*Table continues on the next page...*

**Table 22-2. Interface Modes (continued)**

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
Dual Scan	2bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 8-bit, DDR	1	[7:0],[15:8]	2B[V]	EIGHT	0	1	8BIT	SDCLK x 4
	4bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 8-bit, DDR	1	[7:0],[15:8]	4B[V]	FOUR	0	1	8BIT	SDCLK x 4

### 22.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

#### 22.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through

pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC\_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC\_WB\_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in [Memory Requirements](#).

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

#### 22.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW\_EPDC\_UPD\_CTRL[UPDATE\_MODE] must be set to FULL
- HW\_EPDC\_UPD\_CTRL[WAVEFORM\_MODE] must be set to the INIT waveform (typically 0x00)
- HW\_EPDC\_UPD\_CTRL[USE\_FIXED] must be set
- HW\_EPDC\_UPD\_FIXED[FIXNP\_EN], FIXCP\_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of HW\_EPDC\_UPD\_FIXED allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

### 22.3.5 Dual-Scan Configuration

The EPDC supports ultra-high resolution/refresh rate EPD panels.

At certain resolutions/refresh rates, there exist electrical limitations of the TFT devices and TFT driver ICs such as source drivers. In order to support driving such displays, the EPDC supports the dual-scan driver method.

The specific method involves driving a TFT configuration where there are two sets of source drivers. All source driver control signals are expected to be shared across all source drivers (except the SDCE signals unless a unified CE is presented by the panel).

In this mode, EPDC\_DATA[7:0] is reserved to drive the upper half of the display and EPDC\_DATA[15:8] is reserved to drive the lower half of the panel. The update and working buffers do not have to be aware of the dual-scan operation because the MBM knows how to access the WB for refresh operations based on the settings of the EPDC\_TCE\_CTRL[SCAN\_DIR\_0,1]. The EPDC supports four scan configurations for dual-scan which are shown in the following figures. Each figure shows an example configuration (that is to say, the EPDC is not limited to the support of only 2 source drivers per side).

The dual-scan drive method allows the SDCLK frequency to be halved relative to a single-scan method for the same resolution and refresh rate. In addition to this, each TFT is only charged in half frequency (for any given SDCLK cycle, twice as many pixels are being driven per frame scan).

Because all 16 DATA signals must be utilized for dual-scan, there is no support for the LVDS\_MODE. The supported source-driver modes for dual scan are shown in [Table 22-2](#). For the 2bpp DDR mode, the EPDC is capable of generating a total of 16 pixels per SDCLK cycle.

Figure 22-7. Dual-Scan Method (Scan = 00)

Figure 22-8. Dual-Scan Method (Scan = 01)

**Figure 22-9. Dual-Scan Method (Scan = 10)**

**Figure 22-10. Dual-Scan Method (Scan = 11)**

### 22.3.6 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

- **Collision Rectangle Detection**

For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submitted.

Details of minimal collision rectangle reported in UPD\_COL\_CORD/  
UPD\_COL\_SIZE.

- **Grey Level Detection (histogram)**

This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)\_PARAM registers before using this functionality.

- **Dry-Run Mode**

Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD\_CTRL[DRY\_RUN] = 1 when writing UPD\_CTRL register .

In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data.. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by `UPD_CTRL[LUT_SEL]` is not used here; the user can start this dry-run update when no LUTs are available.

### 22.3.7 Waveform Mode Selection (AUTOWV)

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV\_LUT register with `AUTOWV_LUT[ADDR]="grey level"`, `AUTOWV_LUT[DATA]="waveform mode"` for each possible grey level reported by the EPDC histogram.

After AUTOWV\_LUT is programmed, AUTOWV mode can be enabled by setting `UPD_CTRL[AUTOWV]=1`. When enabling AUTOWV, the waveform mode written into `UPD_CTRL[WAVEFORM_MODE]` will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into `UPD_CTRL[WAVEFORM_MODE]`.

If the user also sets `UPD_CTRL[DRY_RUN]`, EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the `UPD_CTRL[AUTOWV_PAUSE]` setting:

1. `UPD_CTRL[AUTOWV_PAUSE] = 0, AUTO MODE)`

EPDC will begin waveform loading immediately without any software interaction

2. `UPD_CTRL[AUTOWV_PAUSE] = 1, MANUAL MODE)`

EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into `UPD_CTRL` with final waveform mode, and waveform loading then panel scan will start.

#### NOTE

AUTOWV\_PAUSE is extended for general use so that it can be used independent of AUTOWV feature. Regardless of whether AUTOWV is enabled or not, the user can send updates with `AUTOWV_PAUSE=1`. EPDC will stop after WB processing

and pause before LUT loading and panel scan. Software can explicitly do that latter by writing to UPD\_CTRL with AUTOWV\_PAUSE=0. EPDC will ignore the Update Buffer for this time, and kick off the LUT loading and panel scanning. This feature allows SW modification to the working buffer after EPDC hardware has finished processing it.

### 22.3.8 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4
- PIGEON[05] - SDCE5
- PIGEON[06] - SDCE6
- PIGEON[07] - SDCE7
- PIGEON[08] - SDCE8
- PIGEON[09] - SDCE9
- PIGEON[10] - SDOE
- PIGEON[11] - SDL3
- PIGEON[12] - SDOEZ
- PIGEON[13] - SDOED
- PIGEON[14] - GDSP
- PIGEON[15] - GDOE

#### Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)

2. Increment on event selected through INC\_SEL
3. Count and match SET\_CNT: assert signal, reset counter  
( SET\_CNT==0 means assert immediately on MASK's rising edge )
4. Count and match CLR\_CNT: de-assert signal, stop counter  
(CLR\_CNT==0 means de-assert on MASK's falling edge)

### NOTE

When local counter is running, further changes to MASK are not cared unless CLR\_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE\_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/ Frame Data lines, use the configuration below:

**Table 22-3. STATE\_MASK combinations**

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK\_CNT/MASK\_CNT\_SEL(global counter)

Sometimes a more accurate reference point is required, such as " line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK\_CNT\_SEL, when global counter matches the MASK\_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG\_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC\_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global Counters (selectable through MASK\_CNT\_SEL)

- HCNT / VCNT

normal pclk counter / line counter

- HSTATE\_CNT / VSTATE\_CNT

similar to above, but reset when state changes

- HSTATE\_CYCLE / VSTATE\_CYCLE

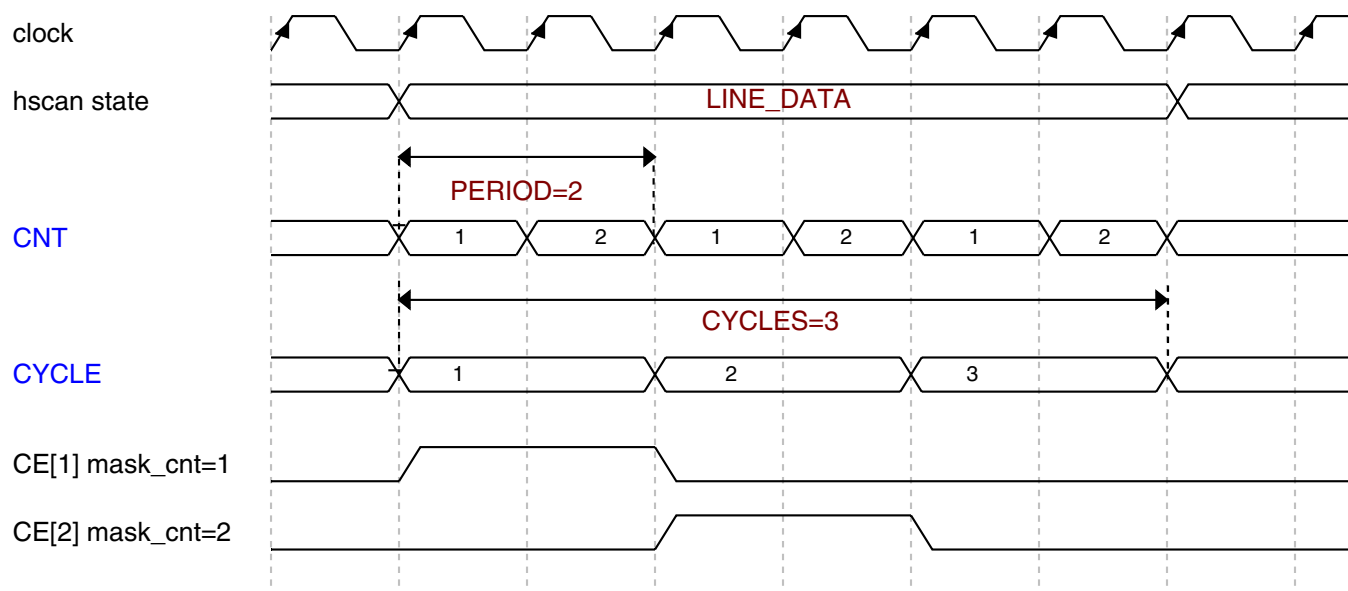

(see figure below for definition of CYCLE/PERIOD/CNT)

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use HW\_EPDC\_PIGEON\_CTRL.\*\_PERIOD to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK\_CNT to generate mask for CE[n].

- FRAME\_CNT / FRAME\_CYCLE (only for frame-crossing signals)

frame cycle counter doesn't have a reset condition; use

HW\_EPDC\_PIGEON\_CTRL1.FRAME\_CNT\_CYCLES to reset it.

**Figure 22-11. Definition of CNT, CYCLE, PERIOD**

The following are register settings for the figure above:

- HW\_EPDC\_PIGEON\_CTRL0.LD\_PERIOD=2
- MASK\_CNT\_SEL = 1 // HSTATE\_CYCLE
- MASK\_CNT = 1 // CE[1]
- MASK\_CNT = 2 // CE[2]

## 22.3.9 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

### 22.3.9.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- EPDC\_STATUS[WB\_BUSY] must be 0. The EPDC cannot process new updates if it is currently processing an update.
- EPDC\_STATUS[LUTS\_BUSY] must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to EPDC\_UPD\_CTRL which initiates the display update).

The following steps can be performed before WB\_BUSY and LUTS\_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC\_TEMP.
- EPDC\_UPD\_ADDR must be set to the 8-bit buffer for the update **if stride feature not enabled (when enabled stride feature, no requirement on align )**. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see [Memory Requirements](#) for details).
- EPDC\_UPD\_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC\_UPD\_SIZE defines the dimension of the update (pixels).
- EPDC\_UPD\_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC\_UPD\_CTRL register initiates a display update:

- USE\_FIXED-This field is set when EPDC\_UPD\_FIXED is used.
- LUT\_SEL-The driver should read EPDC\_STATUS\_NEXLUT[NEXT\_LUT] (qualified by NEXT\_LUT\_VALID) to select an available LUT to assign this update.
- WAVEFORM\_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE\_MODE selects one of two enumerated updated modes.
  - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
  - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC\_FORMAT[DEFAULT\_TFT\_PIXEL] is applied to the pixels which are not changing.

### 22.3.9.2 Update Processing and Collisions

After the update is initiated (by writing EPDC\_UPD\_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB\_CMPLT\_IRQ interrupt. If a collision is detected, the LUT\_COL\_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC\_UPD\_CTRL. After this process is initiated, a waveform takes an amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

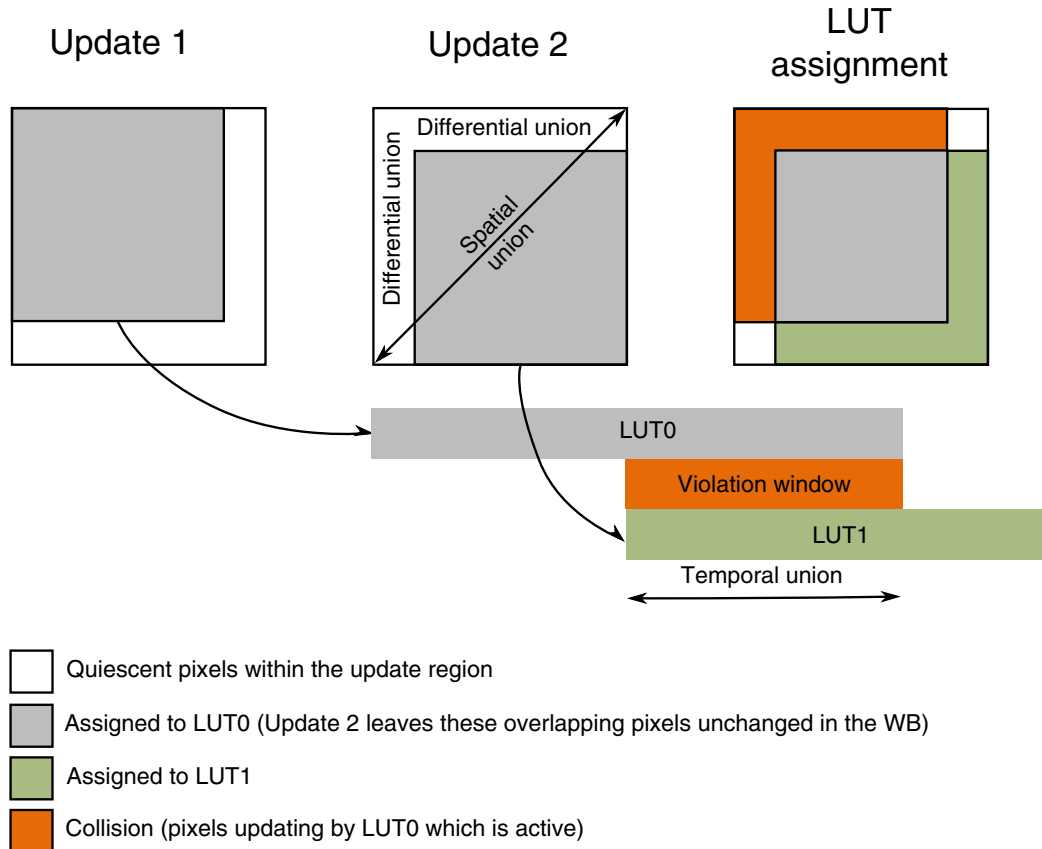

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are referred to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray

overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available) can be assigned) and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

**Figure 22-12. Partial Update Collision Handling**

### NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT\_COL\_IRQ interrupt status bit (this will always happen in conjunction with WB\_CMPLT\_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB\_CMPLT\_IRQ but also for the LUT\_COL\_IRQ status bit within the EPDC\_IRQ register. If LUT\_COL\_IRQ is set, this means that a

collision has occurred. If this is the case the driver should check the value of the EPDC\_STATUS\_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC\_IRQ[LUTn\_CMPLT\_IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC\_STATUS\_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC\_STATUS\_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

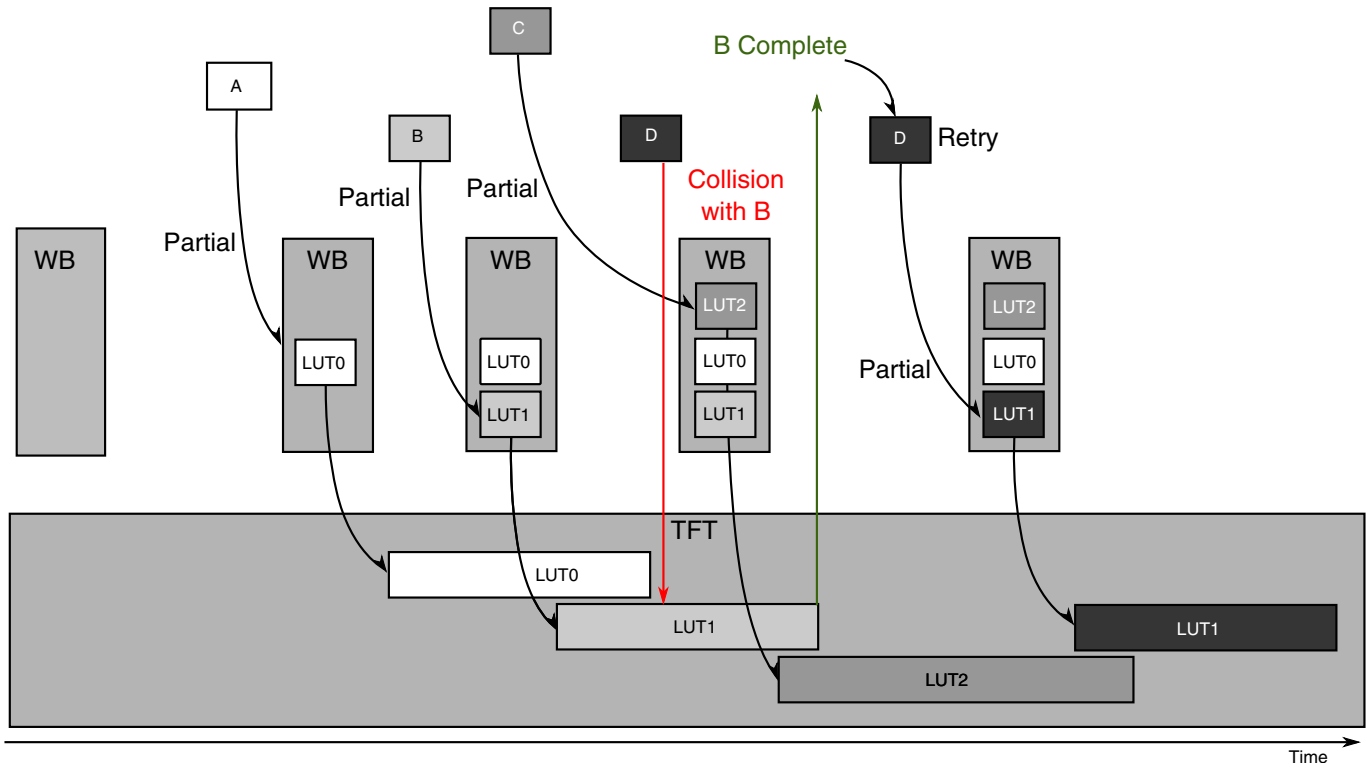

Figure 22-13. Collision Sequence

### 22.3.9.3 Multiple Update Flow

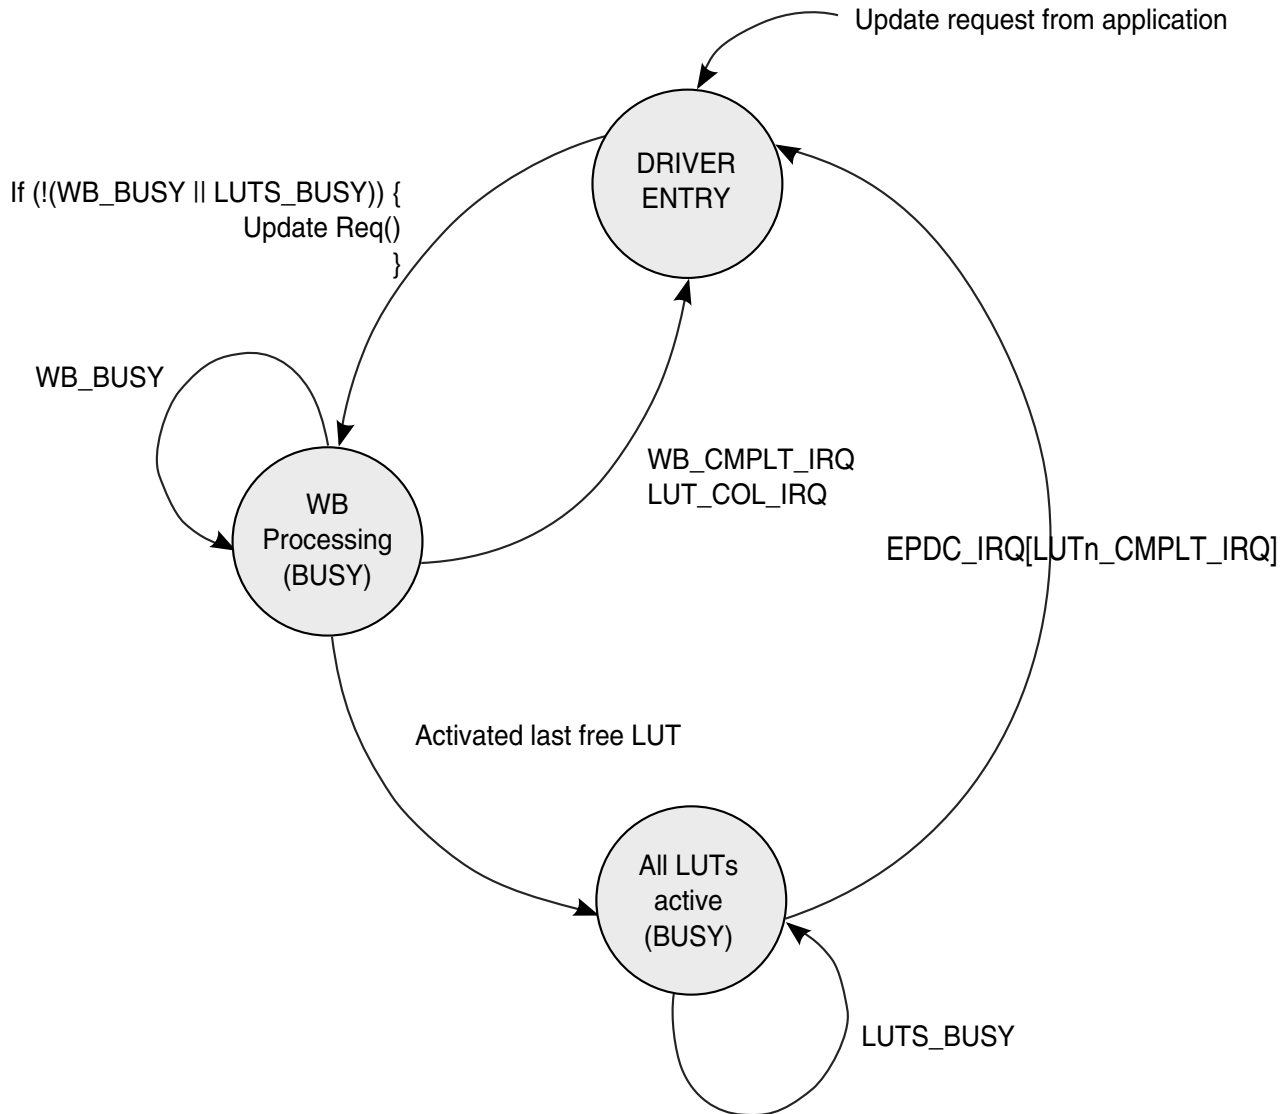

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in [Initiating a Display Update](#), there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

**Figure 22-14. Driver Update Flow**

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the WB\_CMPLT\_IRQ interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as Update\_Req() in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a WB\_CMPLT\_IRQ interrupt issued, but the driver at that time would be in a busy state (because LUTS\_BUSY is signaled). The driver will be re-entered on the next LUTn\_CMPLT\_IRQ interrupt during which time it can issue a new update (since WB\_BUSY and LUTS\_BUSY status bits are low).

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB\_BUSY status and the state of the screen update. In contrast, the LUTn\_CMPLT\_IRQ interrupt status and EPDC\_STATUS\_LUTS provide the status of the physical waveform update. This means that when LUTn\_CMPLT\_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC\_UPD\_CTRL to EPDC\_IRQ[WB\_CMPLT\_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB\_BUSY and LUT\_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC\_STATUS\_LUTS[LUTn\_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not being commenced until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN\_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC\_IRQ[TCE\_UNDERRUN\_IRQ] will fire.

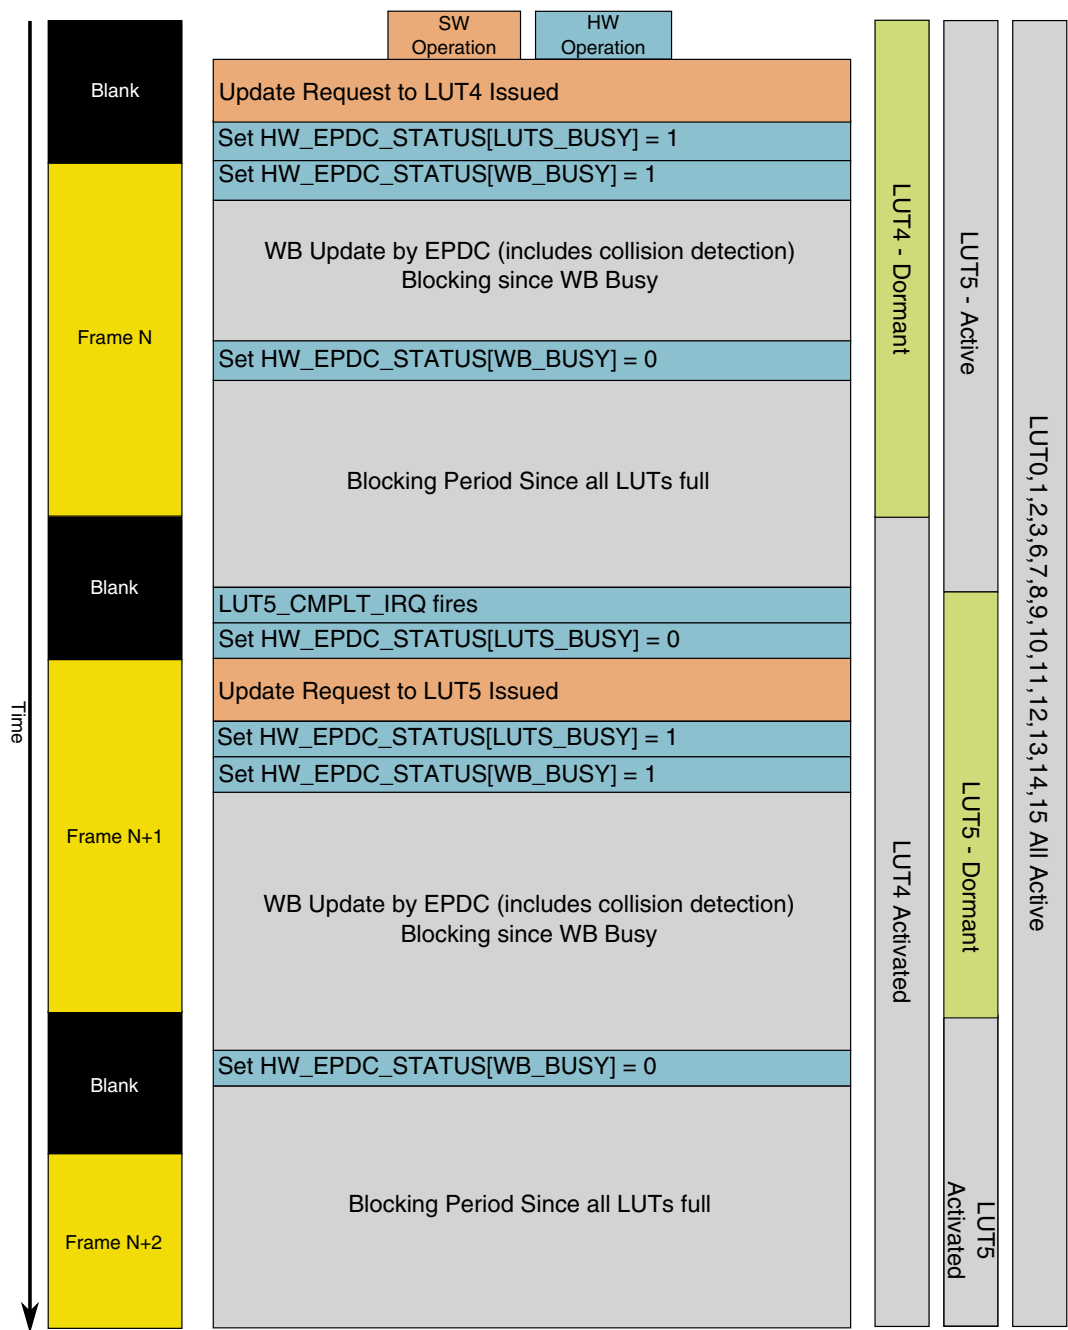

Figure 22-15. Temporal Flow of Update Processing

### 22.3.10 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of `EPDC_CTRL[CLKGATE]`. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must complete the final `FRAME_END` blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final `EPDC_IRQ[LUTn_CMPLT_IRQ]` is reached, the driver should enable the `TCE_IDLE` interrupt mask bit via `EPDC_IRQ_MASK[TCE_IDLE_IRQ_EN]`, unmask other interrupts and return.
- Once the final blanking time of the last LUT (`FRAME_END` time) is completed and the TCE reaches its idle state, the EPDC will assert the `EPDC_IRQ[TCE_IDLE_IRQ]` interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on `EPDC_CTRL[CLKGATE]`.

Alternative implementations of the driver could simply involve polling for the `EPDC_IRQ[TCE_IDLE_IRQ]` interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs `LUTn_CMPLT_IRQ` time and `TCE_IDLE_IRQ` interrupt is equal to the `FRAME_END` time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC\_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

## 22.3.11 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the ARM platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

### 22.3.11.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

**Table 22-4. EPDC Bus Requestor Profiles**

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in [Memory Requirements](#), it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update

while performing refresh operations, but refresh operations always have the highest priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) =  $\text{roundup4}(\text{EPDC\_RES}[\text{HORIZONTAL}]) \times \text{EPDC\_RES}[\text{VERTICAL}] \times \text{Frame Rate} \times (1/\text{Active Time}) \times 2 \times (1/1024^2)$

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

$\text{BW (MB/S)} = 2048 \times 1536 \times 106 \times (1/0.8) \times 2 \times (1/1024^2) = 795 \text{ MB/s}$

(Note that  $2048 \bmod 4 = 0$ .)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

### 22.3.11.2 Pixel Latency FIFOs

The EPDC contains two working buffer latency FIFOs which are used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

These FIFOs are sized at 1024 pixels each in order to provide significant system memory latency tolerance. One pixel FIFO is dedicated for the main screen and the second is in dual-scan cases for the second half of the screen.

Under no circumstance should the EPDC pixel FIFOs reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE\_UNDERRUN\_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFOs are used by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

### 22.3.11.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by EPDC\_FIFOCTRL[FIFO\_INIT\_LEVEL].

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is  $(\text{FIFO\_INIT\_LEVEL}+1) \times 4$ .

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than  $(\text{EPDC\_RES}[\text{VERTICAL}] \times \text{EPDC\_RE}[\text{HORIZONTAL}]) / 4$ .

### 22.3.11.4 Update/Refresh Tuning (VSCAN\_HOLD OFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in [Figure 22-15](#), the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The EPDC\_TCE\_CTRL[VSCAN\_HOLD OFF] control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by VSCAN\_HOLD OFF is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of VSCAN\_HOLD OFF can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

### 22.3.11.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC\_FIFOCTRL registers can be used to drive the `epdc_panic` output signal during times when the EPDC requests require priority elevation. As long as `epdc_panic` is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC\_FIFOCTRL[ENABLE\_PRIORITY] must be set to enable `epdc_panic` functionality.
- EPDC\_FIFOCTRL[FIFO\_L\_LEVEL] determines FIFO threshold which causes `epdc_panic` to assert when crossed.
- EPDC\_FIFOCTRL[FIFO\_H\_LEVEL] once `epdc_panic` has been asserted due to the pixel FIFO(s) crossing FIFO\_L\_LEVEL, this value, which must be set higher than FIFO\_L\_LEVEL, determines the point at which `epdc_panic` will de-assert as the FIFO(s) fills.

Note that the delta between FIFO\_H\_LEVEL and FIFO\_L\_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the `epdc_panic` signal.

Figure 22-16. FIFO Priority Elevation

## 22.4 EPDC Memory Map/Register Definition

### EPDC Register Format Summary

EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20F_4000	EPDC Control Register (EPDC_CTRL)	32	R/W	C000_0000h	<a href="#">22.4.1/951</a>
20F_4004	EPDC Control Register (EPDC_CTRL_SET)	32	R/W	C000_0000h	<a href="#">22.4.1/951</a>
20F_4008	EPDC Control Register (EPDC_CTRL_CLR)	32	R/W	C000_0000h	<a href="#">22.4.1/951</a>
20F_400C	EPDC Control Register (EPDC_CTRL_TOG)	32	R/W	C000_0000h	<a href="#">22.4.1/951</a>
20F_4020	EPDC Waveform Address Pointer (EPDC_WVADDR)	32	R/W	0000_0000h	<a href="#">22.4.2/952</a>
20F_4030	EPDC Working Buffer Address (EPDC_WB_ADDR)	32	R/W	0000_0000h	<a href="#">22.4.3/953</a>
20F_4040	EPDC Screen Resolution (EPDC_RES)	32	R/W	0000_0000h	<a href="#">22.4.4/954</a>

**22.4.1 EPDC Control Register (EPDC\_CTRL<sub>n</sub>)**

EPDC Main control register

This register controls various high-level functions of the EPDC

**EXAMPLE**

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);

```

Address: 20F\_4000h base + 0h offset + (4d × i), where i=0d to 3d

## EPDC Memory Map/Register Definition

### EPDC\_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–8 -	This field is reserved. Reserved
7–6 UPD_DATA_SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Plesae note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations:  0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
5–4 LUT_DATA_SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations:  0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
3–1 -	This field is reserved. Reserved.
0 BURST_LEN_8	0- EPDC display fifo logic will issue AXI bursts of length 16. When set to 1, the block will issue bursts of length 8.

## 22.4.2 EPDC Waveform Address Pointer (EPDC\_WVADDR)

### EPDC Waveform Address Pointer

#### EXAMPLE

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);

```

```

while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);

```

Address: 20F\_4000h base + 20h offset = 20F\_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ADDR																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### EPDC\_WVADDR field descriptions

Field	Description
31–0 ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

## 22.4.3 EPDC Working Buffer Address (EPDC\_WB\_ADDR)

### EPDC Working Buffer Address

Address: 20F\_4000h base + 30h offset = 20F\_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ADDR																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_WB\_ADDR field descriptions

Field	Description
31–0 ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

### 22.4.4 EPDC Screen Resolution (EPDC\_RES)

EPDC Screen Resolution. This register defines the horizontal and vertical resolution of the target display panel

Address: 20F\_4000h base + 40h offset = 20F\_4040h

EPDC\_RES field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 VERTICAL	Vertical Resolution (in pixels)
15–13 -	This field is reserved. Reserved.
12–0 HORIZONTAL	Horizontal Resolution (in pixels)

### 22.4.5 EPDC Format Control Register (EPDC\_FORMATn)

EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

EXAMPLE

```
/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
    | EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
    | ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
    EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
```

Address: 20F\_4000h base + 50h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								BUF_PIXEL_ SCALE	DEFAULT_TFT_PIXEL						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved						BUF_PIXEL_ FORMAT		Reserved						TFT_PIXEL_ FORMAT	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_FORMAT $n$  field descriptions**

Field	Description
31–25 -	This field is reserved. Reserved.
24 BUF_PIXEL_ SCALE	Selects method of conversion from 8-bit input  0x0 <b>TRUNCATE</b> — Use Truncate method (LSB) 0x1 <b>ROUND</b> — Use rounding method (with saturation)
23–16 DEFAULT_TFT_ PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15–11 -	This field is reserved. Reserved.
10–8 BUF_PIXEL_ FORMAT	EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms)  0x2 <b>P2N</b> — 2-bit pixel 0x3 <b>P3N</b> — 3-bit pixel 0x4 <b>P4N</b> — 4-bit pixel 0x5 <b>P5N</b> — 5-bit pixel
7–2 -	This field is reserved. Reserved.
1–0 TFT_PIXEL_ FORMAT	EPDC TFT Pixel Format. This defines how many bits of the DATA bus are required per pixel. This field must be consistent with the waveform and panel architecture.  0x0 <b>2B</b> — 2-bit 0x1 <b>2BV</b> — 2-bit and VCOM 0x2 <b>4B</b> — 4-bit 0x3 <b>4BV</b> — 4-bit and VCOM

22.4.6 EPDC FIFO control register (EPDC\_FIFOCTRLn)

Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware

This register houses FIFO control bits

EXAMPLE

```
/* EPDC_FIFOCTRL (disabled) */
reg_val =
  ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
   EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
  | ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
   EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
  | ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
   EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);
```

Address: 20F\_4000h base + A0h offset + (4d × i), where i=0d to 3d

EPDC\_FIFOCTRLn field descriptions

Field	Description
31 ENABLE_PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 -	This field is reserved. Reserved.
23–16 FIFO_INIT_LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated

Table continues on the next page...

**EPDC\_FIFOCTRLn field descriptions (continued)**

Field	Description
7–0 FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

**22.4.7 EPDC Update Region Address (EPDC\_UPD\_ADDR)****EPDC Update Region Address**

The address alignment depends on whether the update region stride register (EPDC\_UPD\_STRIDE) is set or not.

If EPDC\_UPD\_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC\_UPD\_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recommended to get best bus performance.

**EXAMPLE1**

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100; /* 8-byte aligned */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

**EXAMPLE2**

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123; /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 20F\_4000h base + 100h offset = 20F\_4100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_ADDR field descriptions**

Field	Description
31–0 ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

## 22.4.8 EPDC Update Region Stride (EPDC\_UPD\_STRIDE)

### EPDC Update Region Stride

When UPD\_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD\_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD\_WIDTH should be set to real line bytes count as normal, while UPD\_STRIDE set to byte distance between two lines' start.

### EXAMPLE

see details on stride feature introduction

Address: 20F\_4000h base + 110h offset = 20F\_4110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_UPD\_STRIDE field descriptions

Field	Description
31–0 STRIDE	line stride for incoming region update

## 22.4.9 EPDC Update Command Co-ordinate (EPDC\_UPD\_CORD)

### EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 20F\_4000h base + 120h offset = 20F\_4120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				YCORD												Reserved				XCORD											
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### EPDC\_UPD\_CORD field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for incoming region update

Table continues on the next page...

**EPDC\_UPD\_CORD field descriptions (continued)**

Field	Description
15–13 -	This field is reserved. Reserved.
12–0 XCORD	X co-ordinate for incoming region update

**22.4.10 EPDC Update Command Size (EPDC\_UPD\_SIZE)**

## EPDC Update Command Size

This register sets up the size of an update region.

Address: 20F\_4000h base + 140h offset = 20F\_4140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved			HEIGHT													Reserved			WIDTH												
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**EPDC\_UPD\_SIZE field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
12–0 WIDTH	Width (in pixels)

## 22.4.11 EPDC Update Command Control (EPDC\_UPD\_CTRLn)

EPDC Update Command Control. Writing to this registers triggers and update request operation.

Address: 20F\_4000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	USE_FIXED	Reserved										LUT_SEL				
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	WAVEFORM_MODE								Reserved			NO_LUT_CANCEL	AUTOWV_PAUSE	AUTOWV	DRY_RUN	UPDATE_MODE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_CTRLn field descriptions**

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of EPDC_UPD_FIXED)
30–22 -	This field is reserved. Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_MODE	Waveform Mode 0-255
7–5 -	This field is reserved. Reserved.
4 NO_LUT_CANCEL	EPDC will cancel LUT loading for void update (no real update needed because of partial or collision), set this bit to 1 to disable this feature
3 AUTOWV_PAUSE	0x0 <b>AUTO</b> — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 <b>MANUAL</b> — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading

*Table continues on the next page...*

**EPDC\_UPD\_CTRL $n$  field descriptions (continued)**

Field	Description
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 <b>PARTIAL</b> — Partial Update : only process changed pixels in region 0x1 <b>FULL</b> — Full Update : process all pixels in region

**22.4.12 EPDC Update Fixed Pixel Control (EPDC\_UPD\_FIXED $n$ )**

EPDC Update Control register for fixed-pixel updates (enabled via EPDC\_UPD\_CTRL[USE\_FIXED])

Address: 20F\_4000h base + 180h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	FIXNP_EN	FIXCP_EN	Reserved													
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	FIXNP								FIXCP							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_FIXED $n$  field descriptions**

Field	Description
31 FIXNP_EN	If set to 1, current updated region has the NP value defined by FIXNP
30 FIXCP_EN	If set to 1, current updated region has the CP value defined by FIXCP
29–16 -	This field is reserved. Reserved.
15–8 FIXNP	NP value if fixenp_en is set to 1. Data in Y8 format.
7–0 FIXCP	CP value if fixecp_en is set to 1. Data in Y8 format.

## 22.4.13 EPDC Temperature Register (EPDC\_TEMP)

### EPDC Temperature Compensation Register

Address: 20F\_4000h base + 1A0h offset = 20F\_41A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	TEMPERATURE																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_TEMP field descriptions

Field	Description
31–0 TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

## 22.4.14 Waveform Mode Lookup Table Control Register. (EPDC\_AUTOWV\_LUT)

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV\_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV\_LUT mem indexed with 'ADDR'

Address: 20F\_4000h base + 1C0h offset = 20F\_41C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								DATA								Reserved															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_AUTOWV\_LUT field descriptions

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 DATA	DATA
15–3 -	This field is reserved. Reserved, always set to zero.
2–0 ADDR	ADDR

## 22.4.15 EPDC Timing Control Engine Control Register (EPDC\_TCE\_CTRLn)

TCE general control register

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 20F\_4000h base + 200h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								VSCAN_HOLDOFF							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				VCOM_VAL		VCOM_MODE	DDR_MODE	LVDS_MODE_	LVDS_MODE	SCAN_DIR_1	SCAN_DIR_0	DUAL_SCAN	SDDO_WIDTH	PIXELS_	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

**EPDC\_TCE\_CTRLn field descriptions**

Field	Description
31–25 -	This field is reserved. Reserved.
24–16 VSCAN_	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 -	This field is reserved. Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 <b>MANUAL</b> — VCOM Value is set manually using VCOM_VAL field 0x1 <b>AUTO</b> — VCOM Value is used from waveform
8 DDR_MODE	If set, DATA is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.

Table continues on the next page...

## EPDC\_TCE\_CTRLn field descriptions (continued)

Field	Description
7 LVDS_MODE_CE	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the DATA bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit DATA interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel 0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel 0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
3 DUAL_SCAN	Enables dual scan-mode. Note in this mode, SDDO_BUS_FORMAT=16BIT must be selected. and PIXELS_PER_CLK applies to each 8-bit segment of the DATA bus.
2 SDDO_WIDTH	Selects either 8 or 16 bit DATA bus format 0x0 <b>8BIT</b> — Connect to 8-bit source driver 0x1 <b>16BIT</b> — Connct to 16-bit source driver
1–0 PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXLK to generate the SDCLK such that $SDCLK = PIXCLK / PIXELS\_PER\_SDCLK$ . For dual-scan mode (DUAL_SCAN=1), this applies to 8-bit half of the 16-bit DATA. It should be noted that when DDR_MODE is enabled, both edges of the clock have to be accounted for in this value, so for example with an 8-bit DATA, 2-bit TFT pixel, this field should be set to EIGHT (four pixels on the pos-edge and 4-pixels on the neg-edge) 0x0 <b>RESERVED</b> — Reserved 0x1 <b>TWO</b> — Two TFT-pixels per SDCLK 0x2 <b>FOUR</b> — Four TFT-pixels per SDCLK 0x3 <b>EIGHT</b> — Eight TFT-pixels per SDCLK

## 22.4.16 EPDC Timing Control Engine Source-Driver Config Register (EPDC\_TCE\_SDCFGn)

### Source-driver configuration register

Address: 20F\_4000h base + 220h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved										SDCLK_HOLD	SDSHR	NUM_CE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SDDO_REFORMAT		SDDO_INVERT	PIXELS_PER_CE												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_SDCFGn field descriptions

Field	Description
31–22 -	This field is reserved. Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface:  0x0 <b>STANDARD</b> — No change. 0x1 <b>FLIP_PIXELS</b> — Reverses the order of the pixels on DATA. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each DATA bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
12–0 PIXELS_PER_CE	Number of pixels (outputs) per source-driver IC. Please note that EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

## 22.4.17 EPDC Timing Control Engine Gate-Driver Config Register (EPDC\_TCE\_GDCFGn)

This register houses gate-driver configuration.

Address: 20F\_4000h base + 240h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	PERIOD_VSCAN															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								GDRL				Reserved		GDOE_MODE	GDSP_MODE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_GDCFGn field descriptions

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splited, this reg defines the counter period
15–5 -	This field is reserved. Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 -	This field is reserved. Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by EPDC_TCE_TIMING3[GDOE_OFFSET].
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

## 22.4.18 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC\_TCE\_HSCAN1n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 20F\_4000h base + 260h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				LINE_SYNC_WIDTH												Reserved				LINE_SYNC											
W	Reserved				LINE_SYNC_WIDTH												Reserved				LINE_SYNC											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### EPDC\_TCE\_HSCAN1n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_SYNC_WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 -	This field is reserved. Reserved.
11–0 LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

## 22.4.19 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC\_TCE\_HSCAN2n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 20F\_4000h base + 280h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				LINE_END												Reserved				LINE_BEGIN											
W	Reserved				LINE_END												Reserved				LINE_BEGIN											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**EPDC\_TCE\_HSCAN2n field descriptions**

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 -	This field is reserved. Reserved.
11–0 LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

**22.4.20 EPDC Timing Control Engine Vertical Timing Register (EPDC\_TCE\_VSCANn)**

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from EPDC\_RES.

Address: 20F\_4000h base + 2A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_TCE\_VSCANn field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved.
23–16 FRAME_END	Number of lines for frame end duration.
15–8 FRAME_BEGIN	Number of lines for frame begin duration.
7–0 FRAME_SYNC	Number of lines for frame sync duration.

**22.4.21 EPDC Timing Control Engine OE timing control Register (EPDC\_TCE\_OEn)**

This register contain delay programming values for the SDOEZ and SDOED source driver control signals

This register contain delay programming values for the SDOZ and SDOE source driver control signals

Address: 20F\_4000h base + 2C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_TCE\_OEn field descriptions

Field	Description
31–24 SDOED_WIDTH	Number of PIXCLK cycles from SDOED high to SDOED falling (Must be greater than 0)
23–16 SDOED_DLY	Number of PIXCLK cycles from SDOEZ low to SDOED rising (Must be greater than 0)
15–8 SDOEZ_WIDTH	Number of PIXCLK cycles from SDOEZ high to SDOEZ falling (Must be greater than 0)
7–0 SDOEZ_DLY	Number of PIXCLK cycles from SDLE falling edge to SDOEZ rising (Must be greater than 0)

## 22.4.22 EPDC Timing Control Engine Driver Polarity Register (EPDC\_TCE\_POLARITY<sub>n</sub>)

This registers allows for programming the polarity of source/gate driver control signals

This register houses FIFO control bits

Address: 20F\_4000h base + 2E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**EPDC\_TCE\_POLARITY $n$  field descriptions**

Field	Description
31–5 -	This field is reserved. Reserved.
4 GDSP_POL	0 = Active Low, 1 = Active High. Applies to the GDSP output
3 GDOE_POL	0 = Active Low, 1 = Active High. Applies to the GDOE output
2 SDOE_POL	0 = Active Low, 1 = Active High. Applies to the SDOE. Does not apply to SDOEZ and SDOED outputs
1 SDLE_POL	0 = Active Low, 1 = Active High. Applies to the SDLE output
0 SDCE_POL	0 = Active Low, 1 = Active High. Applies to all 10 SDCE outputs

**22.4.23 EPDC Timing Control Engine Timing Register 1 (EPDC\_TCE\_TIMING1 $n$ )**

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 300h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**EPDC\_TCE\_TIMING2n field descriptions**

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover the majority of the line timing
15–0 GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

## 22.4.25 EPDC Timing Control Engine Timing Register 3 (EPDC\_TCE\_TIMING3n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 320h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1		

### EPDC\_TCE\_TIMING3n field descriptions

Field	Description
31–16 GDOE_OFFSET	When using GDOE_MODE=1, this register sets the delay from GDCLK to the GDOE in terms of N PIXCLK cycles
15–0 GDCLK_OFFSET	This register allows the user to shift the GDCLK from the line time by N PIXCLK cycles.

## 22.4.26 EPDC Pigeon Mode Control Register 0 (EPDC\_PIGEON\_CTRL0n)

This register contains global counter settings for Pigeon Mode

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 380h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## EPDC\_IRQ\_MASKn field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23 PWR_IRQ_EN	Enable power interrupt
22 UPD_DONE_IRQ_EN	Enable UPD complete interrupt
21 TCE_IDLE_IRQ_EN	Enable TCE Idle interrupt detection.
20 BUS_ERROR_IRQ_EN	Enable AXI BUS ERROR interrupt detection.
19 FRAME_END_IRQ_EN	If this bit is set, EPDC will assert the current frame end interrupt. This irq is only available during updating period.
18 TCE_UNDERRUN_IRQ_EN	Enable pixel FIFO under-run condition detection.
17 COL_IRQ_EN	Enable collision detection interrupts for all LUTs
16 WB_CMPLT_IRQ_EN	Enable WB complete interrupt
15–0 -	This field is reserved. Reserved.

## 22.4.33 EPDC Interrupt Register (EPDC\_IRQn)

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is completed on the screen. Each interrupt has a corresponding mask register in EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 20F\_4000h base + 420h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### EPDC\_IRQn field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23 PWR_IRQ	Power Interrupt
22 UPD_DONE_IRQ	Working buffer process complete Interrupt
21 TCE_IDLE_IRQ	Interrupt to indicate that the TCE has completed TFT frame scans and is in an idle state.
20 BUS_ERROR_IRQ	Interrupt to indicate AXI BUS error occurs.
19 FRAME_END_IRQ	Interrupt to indicate EPDC has completed the current frame and is in the vertical blanking period.
18 TCE_UNDERRUN_IRQ	Interrupt to indicate that a pixel FIFO under-run has occurred.
17 LUT_COL_IRQ	Collision detection interrupt. Check EPDC_STATUS_COL.
16 WB_CMPLT_IRQ	Working buffer process complete Interrupt
15–0 -	This field is reserved. Reserved.

## 22.4.34 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS1n)

### EPDC Status Register - LUTS 0~31

Address: 20F\_4000h base + 440h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_LUTS1*n* field descriptions**

Field	Description
31–0 LUTN_STS	LUT 0~31 Status : 1=ACTIVE, 0=IDLE

**22.4.35 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS2*n*)****EPDC Status Register - LUTS 0~31**

Address: 20F\_4000h base + 450h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	LUTN_STS																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_STATUS\_LUTS2*n* field descriptions**

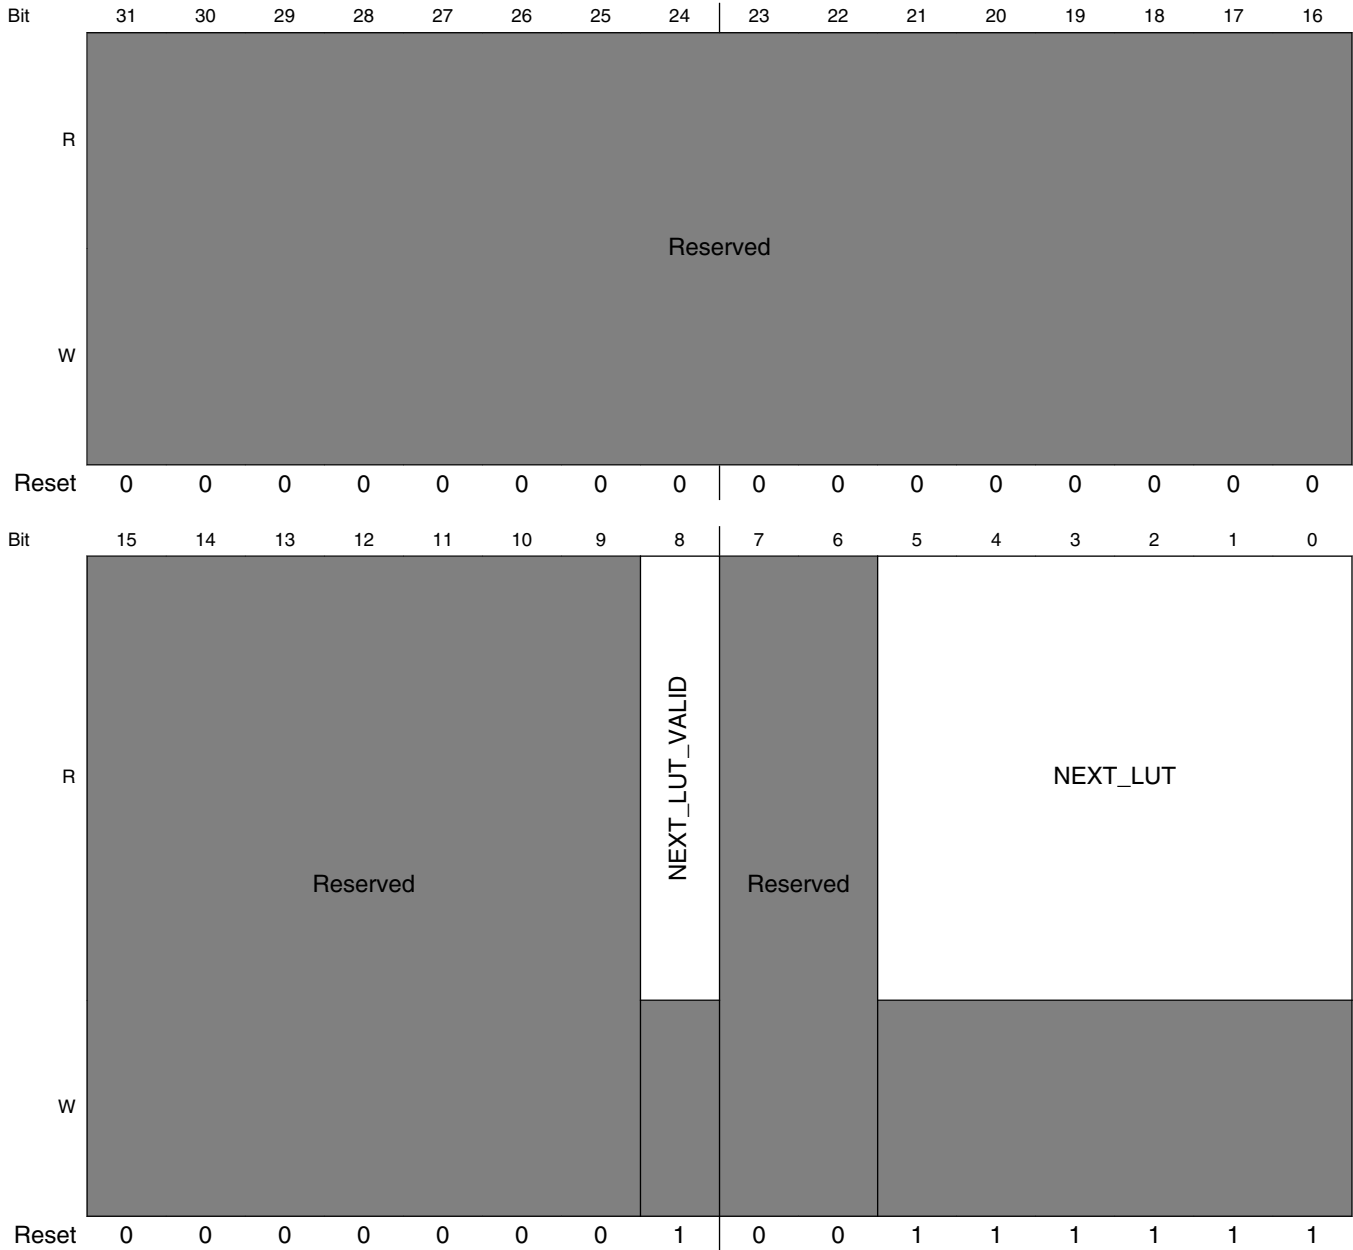

Field	Description
31–0 LUTN_STS	LUT 32~63 Status : 1=ACTIVE, 0=IDLE

**22.4.36 EPDC Status Register - Next Available LUT (EPDC\_STATUS\_NEXTLUT)**

Holds value of next available LUT. Can be used for fast LUT assignment. This value can be read and then used in an update command as part of the EPDC\_UPD\_CTRL register write

The DIGCTL Status Register provides a read-only view to various input conditions and internal states.

Address: 20F\_4000h base + 460h offset = 20F\_4460h

**EPDC\_STATUS\_NEXTLUT field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved.
8 NEXT_LUT_ VALID	This bitfield can be used to check against a LUTs full condition
7–6 -	This field is reserved. Reserved.
5–0 NEXT_LUT	Next available LUT value

22.4.37 EPDC LUT Collision Status (EPDC\_STATUS\_COL1n)

EPDC LUT Collision Status Register and works in conjunction with EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

Address: 20F\_4000h base + 480h offset + (4d × i), where i=0d to 3d

EPDC\_STATUS\_COL1n field descriptions

Field	Description
31–0 LUTN_COL_STS	LUTn Collision Status

### 22.4.38 EPDC LUT Collision Status (EPDC\_STATUS\_COL2n)

EPDC LUT Collision Status Register and works in conjunction with EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

Address: 20F\_4000h base + 490h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_STATUS\_COL2n field descriptions**

Field	Description
31–0 LUTN_COL_STS	LUTn Collision Status

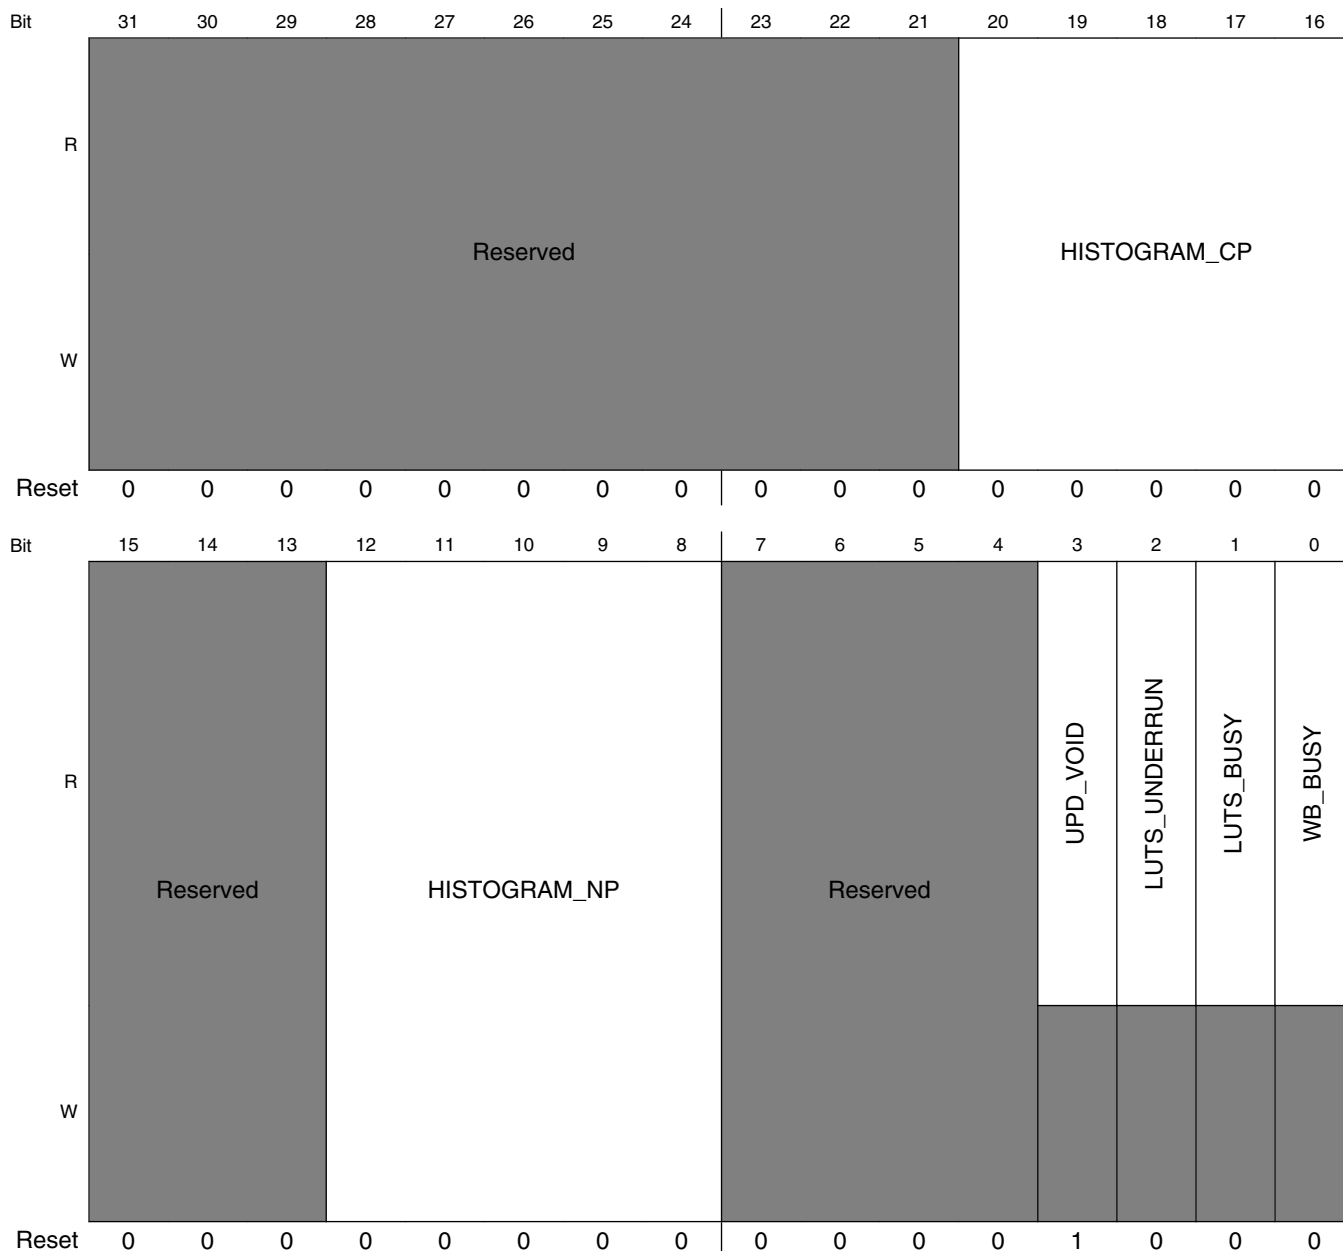

### 22.4.39 EPDC General Status Register (EPDC\_STATUSn)

Register to house non LUT specific status bits

This register houses general status bits

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 4A0h offset + (4d × i), where i=0d to 3d

### EPDC\_STATUSn field descriptions

Field	Description
31–21 -	This field is reserved. Reserved.
20–16 HISTOGRAM_ CP	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram.

*Table continues on the next page...*

**EPDC\_STATUSn field descriptions (continued)**

Field	Description
	Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 -	This field is reserved. Reserved.
12–8 HISTOGRAM_ NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–4 -	This field is reserved. Reserved.
3 UPD_VOID	shows the update buffer is void (don't need any real pixel update)
2 LUTS_ UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLDOFF.
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

## 22.4.40 EPDC Collision Region Co-ordinate (EPDC\_UPD\_COL\_CORD)

EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 20F\_4000h base + 4C0h offset = 20F\_44C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**22.4.42 1-level Histogram Parameter Register.  
(EPDC\_HIST1\_PARAM)**

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 600h offset = 20F\_4600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_HIST1\_PARAM field descriptions

Field	Description
31–5 RSVD	This field is reserved. Reserved, always set to zero.
4–0 VALUE0	value for 1-level histogram

## 22.4.43 2-level Histogram Parameter Register. (EPDC\_HIST2\_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match these two values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 610h offset = 20F\_4610h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_HIST4\_PARAM field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE3	GRAY3 (White) value for 4-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 4-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 4-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
4–0 VALUE0	GRAY0 (Black) value for 4-level histogram

## 22.4.45 8-level Histogram Parameter 0 Register. (EPDC\_HIST8\_PARAM0)

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 630h offset = 20F\_4630h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_HIST16\_PARAM3 field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE15	GRAY15 (White) value for 16-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE14	GRAY14 value for 16-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE13	GRAY13 value for 16-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
4–0 VALUE12	GRAY12 value for 16-level histogram

## 22.4.51 EPDC General Purpose I/O Debug register (EPDC\_GPION)

GPIO register to control EPDC\_BDR[1:0], EPDC\_PWR\_CTRL[3:0] and EPDC\_PWR\_COM output signals

Houses software control signal registers

Address: 20F\_4000h base + 700h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W

## EPDC Memory Map/Register Definition

### EPDC\_GPIOn field descriptions

Field	Description
31–9 -	This field is reserved. Reserved.
8 PWRSTAT	reflect ipp_epdc_pwrstat input
7 PWRWAKE	Controls ipp_epdc_pwrwake output
6 PWRCOM	Controls ipp_epdc_pwrcom output
5–2 PWRCTRL	Controls ipp_epdc_pwrctrl[3:0] output
1–0 BDR	Controls ipp_epdc_bdr[1:0] output

## 22.4.52 EPDC Version Register (EPDC\_VERSION)

This register reflects the version number for the EPDC.

### EXAMPLE

No Example.

Address: 20F\_4000h base + 7F0h offset = 20F\_47F0h

**EPDC\_VERSION field descriptions**

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
15–0 STEP	Fixed read-only value reflecting the stepping of the RTL version.

## 22.4.53 Panel Interface Signal Generator Register 0\_0 (EPDC\_PIGEON\_0\_0)

parameters for timing signal generation

Address: 20F\_4000h base + 800h offset = 20F\_4800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**EPDC\_WB\_ADDR\_TCE field descriptions**

Field	Description
31–0 ADDR	Address for EPDC working buffer (only for TCE). This address must be aligned to a 64-bit double-word boundary.

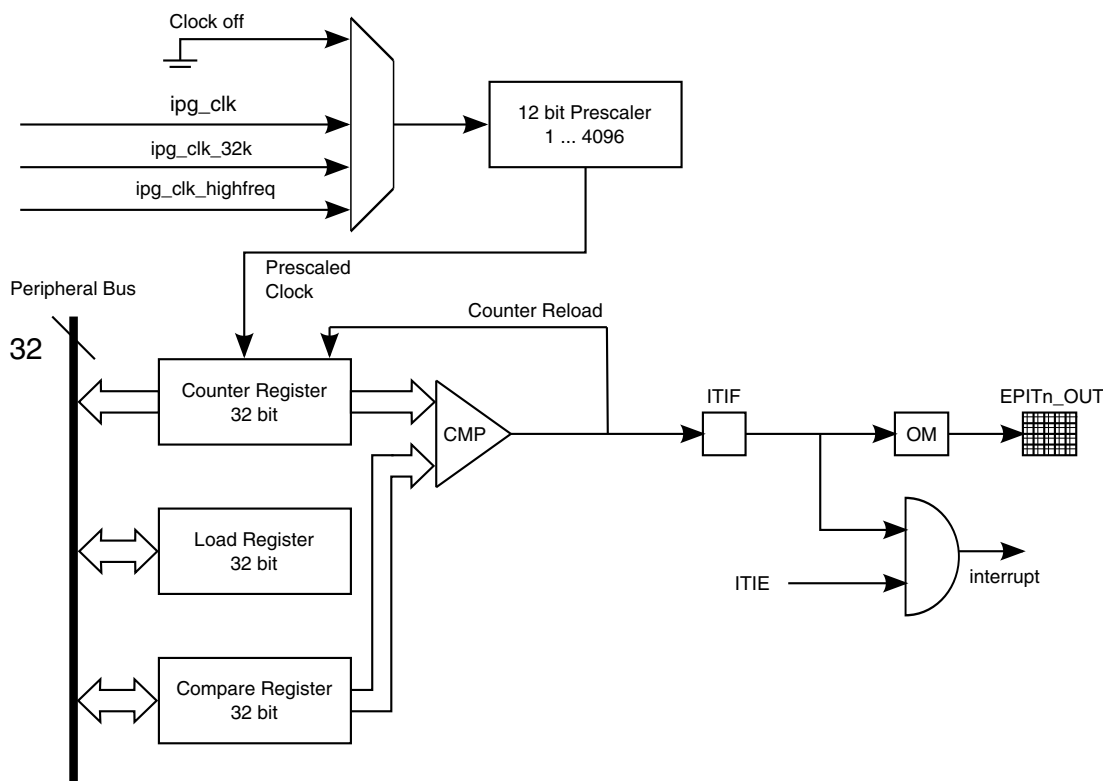

## Chapter 23

# Enhanced Periodic Interrupt Timer (EPIT)

### 23.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

**Figure 23-1. EPIT block diagram**

### 23.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

### 23.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- [Operating in set-and-forget mode](#)
- [Operating in free-running mode](#)

See [Operations](#) for a description of the operations that EPIT supports.

## 23.2 External signals

The following table describes EPIT's I/O signals.

**Table 23-1. EPIT External Signals**

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Output 1 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	PWM1	ALT6	O
		SD2_CMD	ALF4	
		SD3_CMD	ALT4	
EPIT2_OUT	Output 2 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	LCD_DAT2	ALT2	O
		SD3_DAT3	ALT4	

## 23.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 23-2. EPIT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg\_clk\_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg\_clk\_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32kHz crystal.

- **Peripheral clock (ipg\_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT\_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

**Figure 23-2. Prescaler Value Change Diagram**

## 23.4 Functional Description

This section provides a complete functional description of the block.

### 23.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT\_CR[RLD] to select the desired mode.

#### 23.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT\_CR).

In this mode, the counter obtains its data from the load register (EPIT\_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT\_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT\_CR[IOVW]) and write to EPIT\_LR with the required initialization value.

### 23.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT\_EPITCL[IOVW]) and write to EPIT\_EPITLR with the required initialization value.

### 23.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

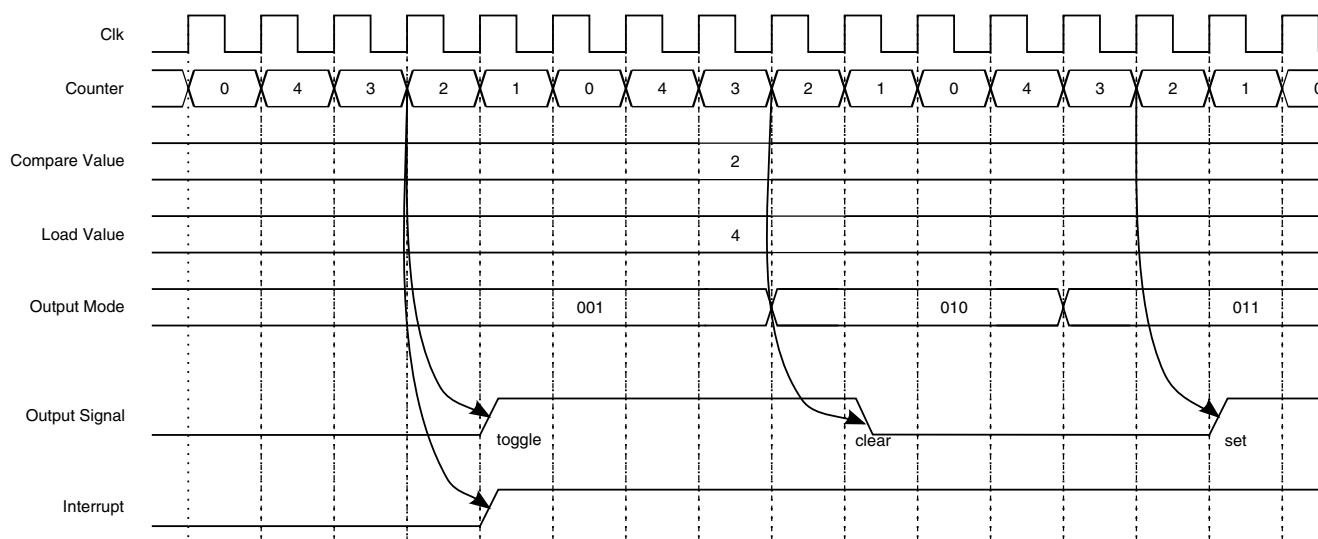

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

### 23.4.3 Compare Event

When the programmed value of EPITx\_EPITCMPR matches the value in EPITx\_EPITCNR, a compare status flag is set, and an interrupt is generated if the OCIE bit is set in the control register.

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000\_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF\_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

**Figure 23-3. Compare Event and Interrupt Timing Diagram**

EPIT will generate a compare event in the next count if the EPITx\_CNR from the previous count equals the new EPITx\_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx\_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx\_CMPR to previous EPITx\_CNR+1. Or, in set and forget mode, configure EPITx\_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx\_CNR.

#### 23.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

### 23.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

### 23.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

## 23.5 Initialization/ Application Information

### 23.5.1 Change of Clock Source

The CLKSRC field in EPIT\_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT\_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT\_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT\_EPITCR.
5. Clear the EPIT status register (EPIT\_EPITSR), that is, write "1" to clear (w1c).

6. Set ENMOD= 1 in the EPIT\_EPITCR, to bring the EPIT Counter to defined state (EPIT\_EPITLR value or 0xFFFF\_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT\_EPITCR
8. Enable the EPIT interrupts.

## 23.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

**EPIT memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	<a href="#">23.6.1/1040</a>
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	<a href="#">23.6.2/1043</a>
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	<a href="#">23.6.3/1044</a>
20D_000C	Compare register (EPIT1_CMPR)	32	R/W	0000_0000h	<a href="#">23.6.4/1044</a>
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	<a href="#">23.6.5/1045</a>
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	<a href="#">23.6.1/1040</a>
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	<a href="#">23.6.2/1043</a>
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	<a href="#">23.6.3/1044</a>
20D_400C	Compare register (EPIT2_CMPR)	32	R/W	0000_0000h	<a href="#">23.6.4/1044</a>
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	<a href="#">23.6.5/1045</a>

### 23.6.2 Control register (EPITx\_CR)

The EPIT control register (EPIT\_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT\_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0						CLKSRC		OM		STOPEN	0	WAITEN	DBGEN	IOVW	SWR

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	PRESCALAR												RLD	OCIE	ENMOD	EN
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## EPITx\_CR field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	Select clock source These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to <a href="#">Change of Clock Source</a> .  00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock
23–22 OM	EPIT output mode. This bit field determines the mode of EPIT output on the output pin.  00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin
21 STOPEN	EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset.  0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit.  0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode
18 DBGEN	This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is reset by hardware reset. A software reset does not affect this bit.

Table continues on the next page...

### EPITx\_CR field descriptions (continued)

Field	Description
	<p>0 Inactive in debug mode</p> <p>1 Active in debug mode</p>
17 IOVW	<p>EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value.</p> <p>0 Write to load register does not result in counter value being overwritten.</p> <p>1 Write to load register results in immediate overwriting of counter value.</p>
16 SWR	<p>Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WAITEN and DBGEN bits in this control register</p> <p>0 EPIT is out of reset</p> <p>1 EPIT is undergoing reset</p>
15–4 PRESCALAR	<p>Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter</p> <p>0x000 Divide by 1</p> <p>0x001 Divide by 2...</p> <p>0xFFFF Divide by 4096</p>
3 RLD	<p>Counter reload control.</p> <p>This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode.</p> <p>0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode)</p> <p>1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)</p>
2 OCIE	<p>Output compare interrupt enable.</p> <p>This bit enables the generation of interrupt on occurrence of compare event.</p> <p>0 Compare interrupt disabled</p> <p>1 Compare interrupt enabled</p>
1 ENMOD	<p>EPIT enable mode.</p> <p>When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/ 0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 Counter starts counting from the value it had when it was disabled.</p> <p>1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)</p>
0 EN	<p>This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p>

Table continues on the next page...

**EPITx\_CR field descriptions (continued)**

Field	Description
0	EPIT is disabled
1	EPIT is enabled

**23.6.3 Status register (EPITx\_SR)**

The EPIT status register (EPIT\_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															OCIF
W																w1c
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPITx\_SR field descriptions**

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit.  0 Compare event has not occurred 1 Compare event occurred

## 23.6.4 Load register (EPITx\_LR)

The EPIT load register (EPIT\_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT\_CR is set. If the IOVW bit in the EPIT\_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	LOAD																															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	

### EPITx\_LR field descriptions

Field	Description
31–0 LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

## 23.6.5 Compare register (EPITx\_CMPR)

The EPIT compare register (EPIT\_CMPR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	COMPARE																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### EPITx\_CMPR field descriptions

Field	Description
31–0 COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

23.6.6 Counter register (EPITx\_CNR)

The EPIT counter register (EPIT\_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT\_CR is set, the value of this register can be overwritten with a write to EPIT\_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

EPITx\_CNR field descriptions

Field	Description
31–0 COUNT	Counter value. This contains the current value of the counter.

# Chapter 24

## Fast Ethernet Controller (FEC)

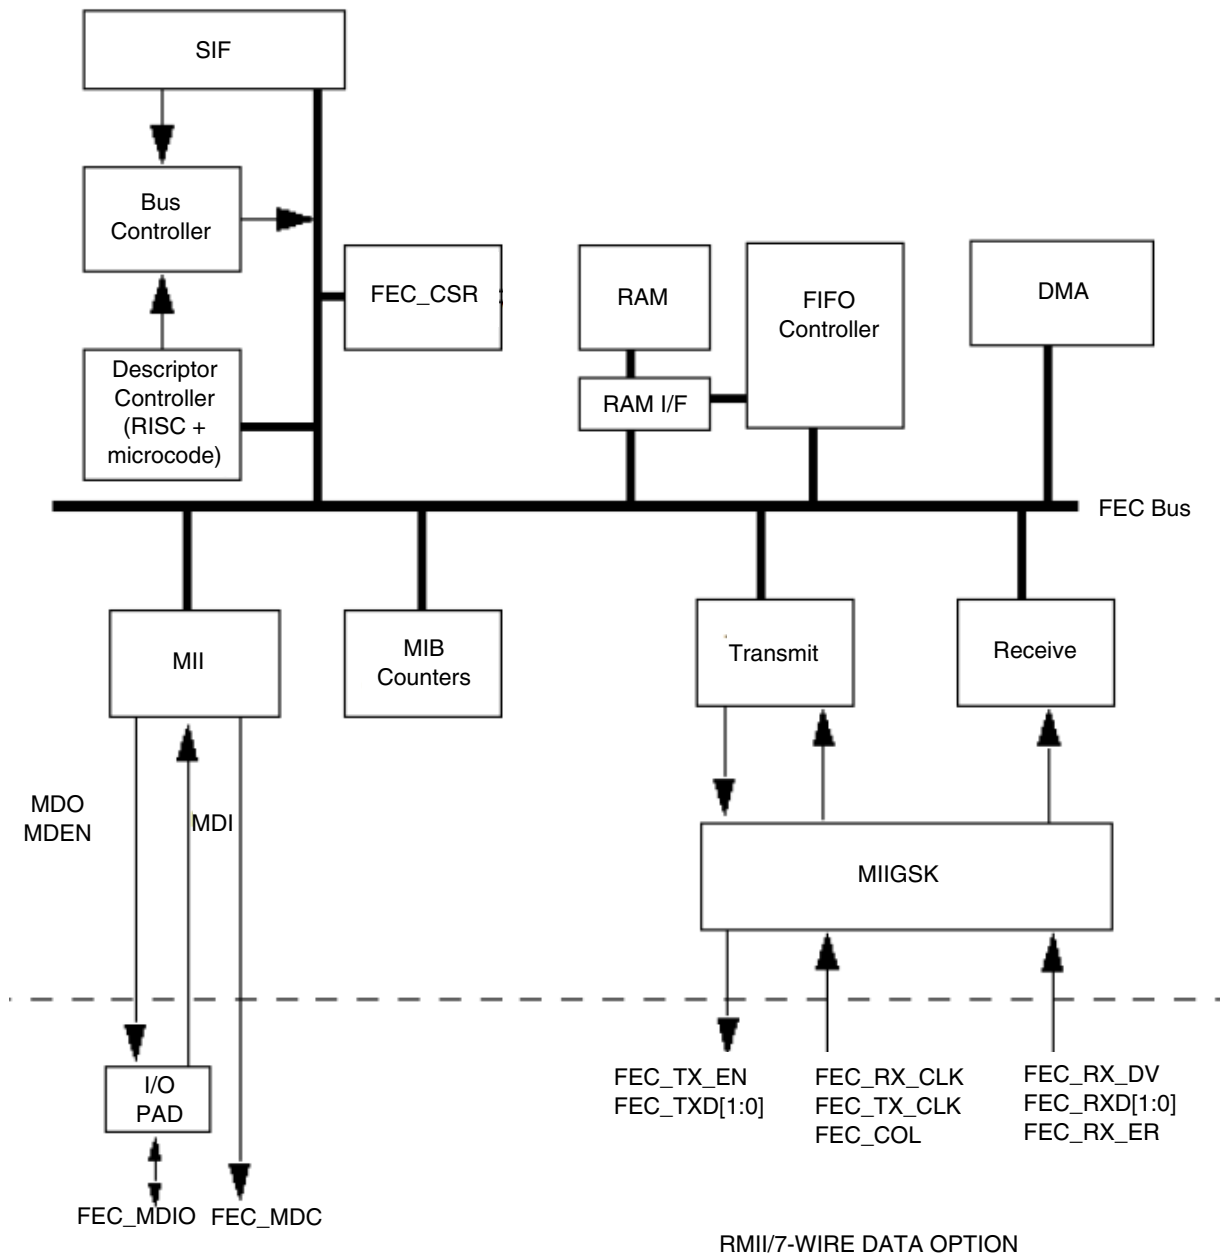

### 24.1 Overview

This chapter provides a feature-set overview, a functional block diagram, and transceiver connection information for the 10- and 100-Mbps reduced media independent interfaces (RMII) and the 7-wire serial interface.

Detailed functional descriptions and application/initialization information are included.

The Fast Ethernet controller (FEC) is designed to support both 10- and 100-Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The FEC supports different standard physical interfaces (MAC-PHY) for connection to an external Ethernet transceiver.

The FEC is implemented with a combination of hardware and microcode. The following figure is a block diagram of the FEC.

**Figure 24-1. FEC Block Diagram**

The following section provides information regarding the FEC submodules.

- The descriptor controller is a RISC-based controller that provides the following functions in the FEC:
  - Initialization (those internal registers not initialized by the user or hardware)
  - High-level control of the DMA channels (initiating DMA transfers)
  - Interpreting buffer descriptors
  - Address recognition for receive frames
  - Random number generation for transmit collision backoff timer

**NOTE**

This DMA engine is for the transfer of FEC data only and is not related to the system DMA controller.

- The RAM is the focal point of all data flow in the FEC and is divided into transmit and receive FIFOs. The FIFO boundaries are programmable using the FEC\_FRSR register. User data flows to and from the DMA block, from and to the receive/transmit FIFOs. Transmit data flows from the transmit FIFO to the transmit block, and receive data flows from the receive block to the receive FIFO.
- The user controls the FEC by writing, through the slave interface (SIF) submodule, to control registers located in each block. The control and status register (FEC\_CSR) provides global control (for example, Ethernet reset and enable) and interrupt handling registers.
- The MII provides a serial channel for control/status communication with the external physical layer device (transceiver). This serial channel consists of the management data clock and management data input/output lines of the MII interface (FEC\_MDC and FEC\_MDIO, respectively).
- The DMA provides multiple channels allowing transmit data, transmit descriptor, receive data and receive descriptor accesses to run independently.
- The transmit and receive blocks provide the Ethernet MAC functionality (with some assistance from microcode).
- The message information block (MIB) maintains counters for a variety of network events and statistics. It is not necessary for operation of the FEC but provides valuable counters for network management. The counters supported are the RMON (RFC 1757) Ethernet statistics group and some of the IEEE 802.3 counters. See Message Information Block (MIB) Counters Memory Map, for more information.
- The MII gasket block (MIIGSK) provides an interface between the MII (Media Independent Interface specified by IEEE 802.3 standard) I/F and RMII (low pin count Reduced Media Independent Interface as specified by the RMII Consortium™ standard) I/F.

## 24.1.1 Features

The FEC incorporates the following features:

- Support for different Ethernet physical interfaces:
  - 10-Mbps and 100-Mbps RMII
  - 10-Mbps 7-wire interface (industry standard)
  - Does not support 10/100-Mbps MII
- IEEE 802.3 full-duplex flow control
- Programmable max frame length supports IEEE 802.1 VLAN tags and priority

- Support for full-duplex operation (200Mbps throughput) with a minimum system clock rate of 50 MHz
- Support for half-duplex operation (100Mbps throughput) with a minimum system clock rate of 25 MHz
- Retransmission from transmit FIFO following a collision (no processor bus utilization)
- Automatic internal flushing of the receive FIFO for runts (collision fragments) and address recognition rejects (no processor bus utilization)
- Address recognition
  - Frames with broadcast address can be always accepted or always rejected
  - Exact match for single 48-bit individual (unicast) address
  - Hash (64-bit hash) check of individual (unicast) addresses
  - Hash (64-bit hash) check of group (multicast) addresses
  - Promiscuous mode

## 24.2 External Signals

Please see [Network Interface Options](#) for external signal information.

## 24.3 Clocks

The following table describes the clock sources for FEC. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 24-1. FEC Clocks**

Clock name	Clock Root	Description
fec_clk	ipg_clk_root	Peripheral clock
fec_hclk	ahb_clk_root	Module / Bus clock

## 24.4 Modes of Operation

The primary operational modes are described in this section.

## 24.4.1 Full- and Half-Duplex Operation

Full-duplex mode is intended for use on point to point links between switches or end node to switch. Half-duplex mode is used in connections between an end node and a repeater or between repeaters.

Selection of the duplex mode is controlled by the FEC\_TCR[FDEN] bit. When configured for full-duplex mode, flow control can be enabled, which is effected by the FEC\_TCR[RFC\_PAUSE], FEC\_TCR[TFC\_PAUSE], and FEC\_RCR[FCE] bits. See [Full-Duplex Flow Control](#), for more details.

## 24.4.2 Interface Options

The following interface options are supported. A detailed discussion of the interface configurations is provided in [Network Interface Options](#).

### 24.4.2.1 10 Mbps and 100 Mbps RMII Interface

RMII is a reduced MII interface specified by the RMII Consortium™ standard. The purpose of this interface is to provide a low cost alternative to the MII, with 8 pin interface instead of 16 (Not including MDC, MDIO pins).

The FEC uses a gasket (MIIGSK) to support RMII. It will operate in RMII mode by setting FEC\_MIIGSK\_CFGR[I/F\_MODE] = 01, while setting FEC\_MIIGSK\_CFGR[I/F\_MODE] = 00 will disable RMII mode. The speed selection in RMII Mode is supported by configuring the FEC\_MIIGSK\_CFGR[FRCONT]. The serial management interface is still available in RMII mode.

### 24.4.2.2 10-Mbps 7-Wire Interface Operation

The FEC supports a 7-wire interface as used by many 10 Mbps ethernet transceivers. The FEC\_RCR[MII\_MODE] bit controls this functionality. If this bit is cleared, the MII mode is disabled and the 10 Mbps, 7-wire mode is enabled.

## 24.4.3 Address Recognition Options

The address options supported are promiscuous, broadcast reject, individual address (hash or exact match), and multicast hash match. Address recognition options are discussed in detail in [Ethernet Address Recognition](#).

## 24.4.4 Internal Loopback

Two levels of internal loopback modes are supported. The first level, which will loop data back before they enter MIIGSK, is selected by FEC\_RCR[LOOP]. The second level, which will loop data back inside MIIGSK RMII domain, is selected by setting FEC\_MIIGSK\_CFGR[LBMODE] and FEC\_MIIGSK\_CFGR[I/F\_MODE] = 01. Loopback mode is discussed in detail in [Internal and External Loopback](#).

## 24.5 Functional Description

This section provides a detailed description of the functions of the FEC.

- Network interface options
- Frame transmission and reception
- Full-duplex flow control
- Internal and external loopback

### 24.5.1 Network Interface Options

The FEC supports an RMII interface for 10/100 Mbps Ethernet and a 7-wire serial interface for 10 Mbps Ethernet.

The interface mode is selected by FEC\_MIIGSK\_CFGR[I/F\_MODE] together with the FEC\_RCR[MII\_MODE] bit as shown in the table below.

**Table 24-2. Interface Mode Selection**

FEC_MIIGSK_CFGR[I/F_MODE]	FEC_RCR[MII_MODE]	Interface Mode Selected
00	0	7-Wire
01	1	RMII

In RMII mode, a reduced set of 10 signals are used. These signals are shown in [Table 24-3](#).

**Table 24-3. RMII Mode Signal Configuration**

Signal Description	FEC Signal	Pad	Mode	Direction
Synchronous clock reference (REF_CLK)	FEC_TX_CLK	FEC_TX_CLK	Alt0	In
Transmit Enable	FEC_TX_EN	FEC_TX_EN	Alt0	Out

*Table continues on the next page...*

**Table 24-3. RMII Mode Signal Configuration (continued)**

Signal Description	FEC Signal	Pad	Mode	Direction
Transmit Data	FEC_TXD[1:0]	FEC_TXD0/1	Alt0	Out
Carrier Sense/Receive Data Valid (CRS_DV)	FEC_RX_DV	FEC_CRD_DV	Alt0	In
Receive Data	FEC_RXD[1:0]	FEC_RXD0/1	Alt0	In
Receive Error	FEC_RX_ER	FEC_RX_ER	Alt0	In
Management Data Clock	FEC_MDC	FEC_MDC	Alt0	Out
Management Data Input/Output	FEC_MDIO	FEC_MDIO	Alt0	I/O

The 7-wire serial interface operates in what is generally referred to as AMD mode. 7-wire mode connections to the external transceiver are shown in [Table 24-4](#).

**Table 24-4. 7-Wire Mode Signal Configuration**

Signal Description	FEC Signal	Pad	Mode	Direction
Transmit clock	FEC_TX_CLK	FEC_TX_CLK	Alt0	In
Transmit enable	FEC_TX_EN	FEC_TX_EN	Alt0	Out
Transmit data	FEC_TXD[0]	FEC_TXD0	Alt0	Out
Collision	FEC_COL	FEC_RXD1	Alt6	In
Receive clock	FEC_RX_CLK	FEC_TXD1	Alt6	In
Receive data valid	FEC_RX_DV	FEC_CRD_DV	Alt0	In
Receive data	FEC_RXD[0]	FEC_RXD0	Alt0	In

## 24.5.2 FEC Frame Transmission

The Ethernet transmitter is designed to work with almost no intervention from software.

After FEC\_ECR[ETHER\_EN] is set to 1 and data appears in the transmit FIFO, the FEC is able to transmit on to the network.

When the transmit FIFO fills to the watermark (defined by the FEC\_TFWR register), the FEC transmit logic asserts FEC\_TX\_EN and starts transmitting the preamble (PA) sequence, the start frame delimiter (SFD), and then the frame information from the FIFO. However, the controller postpones transmission if the network is busy (that is, the carrier sense signal FEC\_CRD is asserted). Before transmitting, the controller waits for carrier sense to become inactive, then determines if carrier sense remains inactive for 60 bit periods. If so, the transmission begins after waiting an additional 36 bit periods (96 bit periods after carrier sense originally became inactive). See [Transmission Error Handling](#) for more details.

If a collision occurs during transmission of a frame in half-duplex mode, the Ethernet controller follows the specified backoff procedures (see [Collision Handling](#)) and attempts to retransmit the frame until the retry limit is reached. The transmit FIFO stores at least the first 64 bytes of the transmit frame, so that they do not have to be retrieved from system memory in case of a collision. This improves bus utilization and latency in case immediate retransmission is necessary.

When all the frame data has been transmitted, if the TC bit is set in the transmit frame control word then a 32-bit cyclic redundancy check (CRC) known as the frame check sequence (FCS) is appended. If the ABC bit is set in the transmit frame control word, a bad CRC is appended to the frame data regardless of the TC bit value. Following the transmission of the CRC, the Ethernet controller writes the frame status information to the MIB block. Short frames are automatically padded by the transmit logic (if the TC bit in the transmit buffer descriptor for the end of frame buffer is set to 1).

Both buffer (TXB) and frame (TXF) interrupts can be generated as determined by the settings in the FEC\_EIMR.

The transmit error interrupts are HBERR, BABT, LATE\_COL, COL\_RETRY\_LIM, and XFIFO\_UN. If the transmit frame length exceeds MAX\_FL bytes the BABT interrupt is asserted: however, the entire frame is transmitted (no truncation).

Transmission is paused by setting the graceful transmit stop (GTS) bit in the FEC\_TCR register. When the FEC\_TCR[GTS] is set to 1, the FEC transmitter stops immediately if transmission is not in progress; otherwise, it continues transmission until the current frame either finishes or terminates with a collision. After the transmitter has stopped the GRA (graceful stop complete) interrupt is asserted. If FEC\_TCR[GTS] is cleared, the FEC resumes transmission with the next frame.

The Ethernet controller transmits bytes LSB first.

### **24.5.2.1 Transmit Inter-Packet Gap (IPG) Time**

The minimum inter-packet gap (IPG) time for back-to-back transmission is 96 bit periods. After completing a transmission or after the backoff algorithm completes, the transmitter waits for carrier sense to be negated before starting its 96-bit-period IPG counter. Frame transmission begins 96 bit periods after carrier sense is negated if it stays negated for at least 60 bit periods. If carrier sense is asserted during the last 36 bit periods, it is ignored and a collision occurs.

### 24.5.2.2 Collision Handling

If a collision occurs during frame transmission, the Ethernet controller continues the transmission for at least 32 bit periods, transmitting a jam pattern consisting of 32 ones.

If the collision occurs during the preamble sequence, the jam pattern is sent after the end of the preamble sequence.

If a collision occurs within 512 bit periods, the retry process is initiated. The transmitter waits a random number of slot periods, where one slot period is 512 bit periods. If a collision occurs after 512 bit periods, then no retransmission is performed and the end of frame buffer is closed with a late collision (LC) error indication.

### 24.5.2.3 Transmission Error Handling

The Ethernet controller reports frame transmission error conditions using the FEC RxBDs, the FEC\_EIR register, and the MIB block counters.

There are four types of transmission errors:

- Transmitter underrun
- Retransmission attempts limit expired
- Late collision
- Heartbeat

The FEC's procedures for handling these errors are described in the following subsections.

#### 24.5.2.3.1 Transmitter Underrun

If this error occurs, the FEC sends 32 bits that ensure a CRC error, then stops transmitting. All remaining buffers for that frame are then flushed and closed. The UN bit is set in the FEC\_EIR and the UN interrupt is asserted (if enabled in the FEC\_EIMR register). The FEC then continues to the next transmit buffer descriptor and begin transmitting the next frame.

#### 24.5.2.3.2 Retransmission Attempts Limit Expired

When this error occurs, the FEC terminates transmission. All remaining buffers for that frame are flushed and closed, and the RL bit is set in the FEC\_EIR. The FEC then continues to the next transmit buffer descriptor and begin transmitting the next frame.

The "RL" interrupt is asserted if enabled in the FEC\_EIMR register.

### 24.5.2.3.3 Late Collision

When a collision occurs after the slot time (512 bits starting at the preamble), the FEC terminates transmission. All remaining buffers for that frame are flushed and closed, and the LC bit is set in the FEC\_EIR register. The FEC then continues to the next transmit buffer descriptor and begin transmitting the next frame.

The LC interrupt is asserted if enabled in the FEC\_EIMR register.

### 24.5.2.3.4 Heartbeat

Some transceivers have a self-test feature called "heartbeat" or "signal quality error." To signify a good self-test, the transceiver indicates a collision to the FEC within 4 microseconds after completion of a frame transmitted by the Ethernet controller. This indication of a collision does not imply a real collision error on the network, but is rather an indication that the transceiver still seems to be functioning properly. This is called the heartbeat condition.

If the HBC bit is set in the FEC\_TCR register and the heartbeat condition is not detected by the FEC after a frame transmission, then a heartbeat error occurs. When this error occurs, the FEC closes the buffer, sets the HB bit in the FEC\_EIR register, and generates the HBERR interrupt if it is enabled.

## 24.5.3 FEC Frame Reception

The FEC receiver is designed to work with almost no intervention from the host and can perform address recognition, CRC checking, short frame checking, and maximum frame length checking.

When the driver enables the FEC receiver by setting FEC\_ECR[ETHER\_EN] to 1, it immediately starts processing receive frames. When FEC\_RX\_DV asserts, the receiver first checks for a valid PA/SFD header. If the PA/SFD is valid, it is stripped and the frame is processed by the receiver. If a valid PA/SFD is not found, the frame is ignored.

In serial mode, the first 16 bit periods of RX\_D0 following assertion of FEC\_RX\_DV are ignored. Following the first 16 bit periods the data sequence is checked for alternating 1/0s. If a 0b11 or 0b00 data sequence is detected during bit periods 17 to 21, the remainder of the frame is ignored. After bit period 21, the data sequence is monitored for a valid SFD (11). If a 0b00 is detected, the frame is rejected. When a 0b11 is detected, the PA/SFD sequence is complete.

In RMII mode, the receiver checks for at least one byte matching the SFD. Zero or more PA bytes can occur, but if a 0b00 bit sequence is detected prior to the SFD byte, the frame is ignored.

After the first 6 bytes of the frame have been received, the FEC performs address recognition on the frame.

After a collision window (64 bytes) of data has been received, and if address recognition has not rejected the frame, the receive FIFO is signaled that the frame is accepted and can be passed on to the DMA. If the frame is a runt (due to collision) or is rejected by address recognition, the receive FIFO is notified to reject the frame. Thus no collision fragments are presented to the user except late collisions, which indicate serious LAN problems.

During reception, the Ethernet controller checks for various error conditions and after the entire frame is written into the FIFO, a 32-bit frame status word is written into the FIFO. This status word contains the M, BC, MC, LG, NO, CR, OV and TR status bits, and the frame length. See [Reception Error Handling](#) for more details.

Receive Buffer (RXB) and Frame Interrupts (RXF) can be generated if enabled by the FEC\_EIMR register. The only receive error interrupt is babbling receiver error (BABR). Receive frames are not truncated if they exceed the max frame length (MAX\_FL); however, the BABR interrupt occurs and the LG bit in the receive buffer descriptor (RxBD) is set. See [Ethernet Receive Buffer Descriptor \(RxBD\)](#) for more details.

When the receive frame is complete, the FEC sets the L bit in the RxBD, writes the other frame status bits into the RxBD, and clears the E bit. The Ethernet controller next generates a maskable interrupt (RXF bit in FEC\_EIR, maskable by RXF bit in FEC\_EIMR), indicating that a frame has been received and is in memory. The Ethernet controller then waits for a new frame.

The Ethernet controller receives serial data LSB first.

### 24.5.3.1 Receive Inter-Packet Gap (IPG) Time

The receiver receives back-to-back frames with a minimum spacing of 28-bit periods. If an inter-packet gap between receive frames is less than 28 bit periods, the second frame may be discarded by the receiver.

### 24.5.3.2 Ethernet Address Recognition

Address recognition is accomplished through the use of the receive block and microcode running on the microcontroller.

The flowchart shown in [Figure 24-2](#) illustrates the address recognition decisions made by the receive block, while [Figure 24-3](#) illustrates the decisions made by the microcontroller.

The FEC filters the received frames based on destination address (DA) type - individual (unicast), group (multicast), or broadcast (all-ones group address). The difference between an individual address and a group address is determined by the I/G bit in the DA field.

If the DA is a broadcast address, and broadcast reject (FEC\_RCR[BC\_REJ]) is cleared, then the frame is accepted unconditionally, as shown in [Figure 24-2](#). Otherwise, if the DA is not a broadcast address, then the microcontroller runs the address recognition subroutine, as shown in [Figure 24-3](#).

If the DA is a group (multicast) address and flow control is disabled, then the microcontroller performs a group hash table lookup using the 64-entry hash table programmed in FEC\_GAUR and FEC\_GALR. If a hash match occurs, the receiver accepts the frame. The hash algorithm is described in [Hash Algorithm](#).

If flow control is enabled, the microcontroller does an exact address match check between the DA and the designated PAUSE DA (01:80:C2:00:00:01). If the receive block determines that the received frame is a valid pause frame, then the frame is rejected.

### **NOTE**

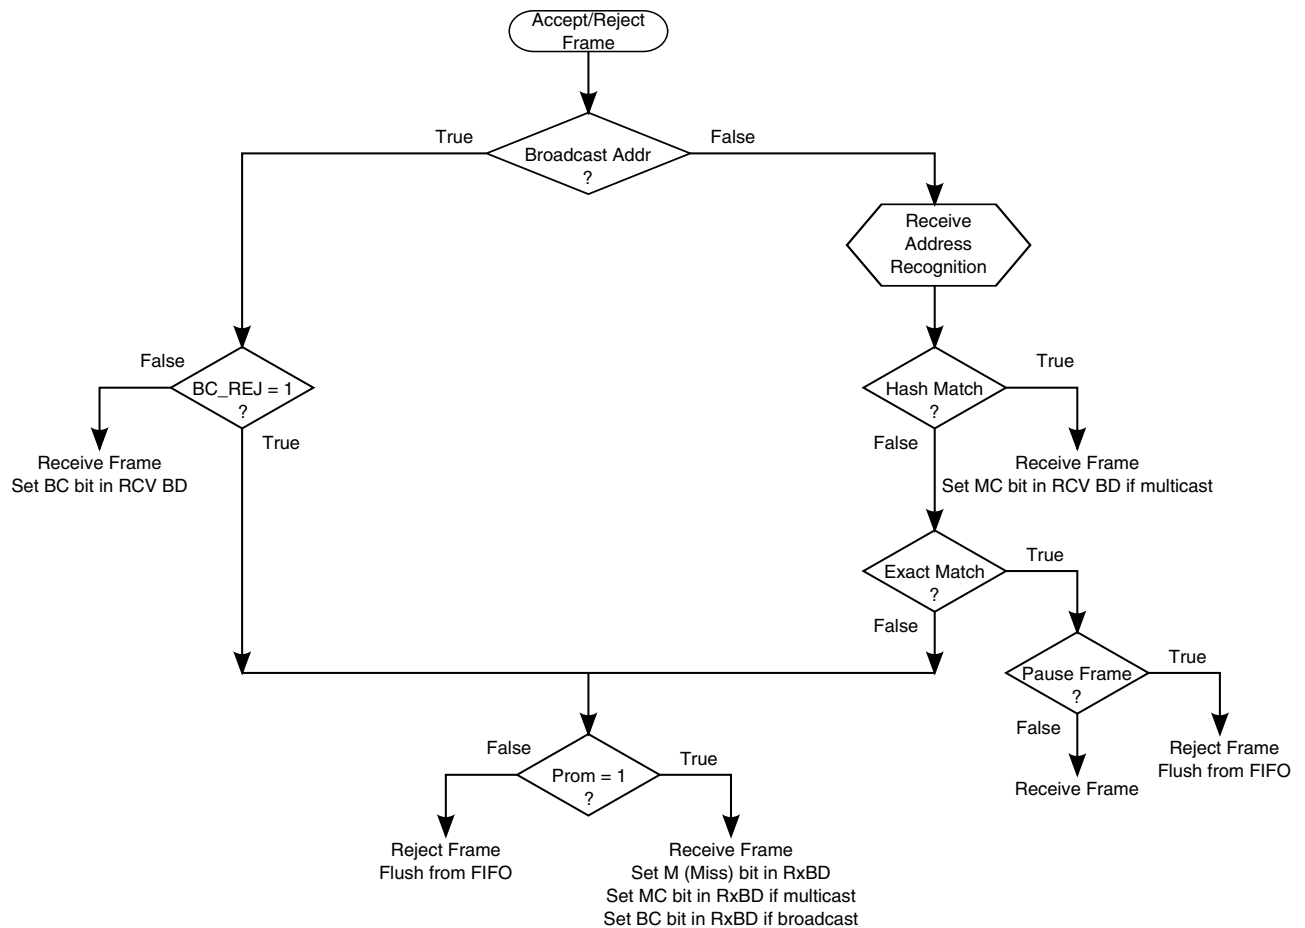

The receiver detects a pause frame with the DA field set to either the designated PAUSE DA or the unicast physical address.

If the DA is the individual (unicast) address, the microcontroller performs an individual exact match comparison between the DA and 48-bit physical address that the user programs in the FEC\_PALR and FEC\_PAUR registers. If an exact match occurs, the frame is accepted; otherwise, the microcontroller does an individual hash table lookup using the 64-entry hash table programmed in registers, FEC\_IAUR and FEC\_IALR (the hash algorithm is described in [Hash Algorithm](#)). In the case of an individual hash match, the frame is accepted. Again, the receiver accepts or rejects the frame based on pause frame detection, shown in [Figure 24-2](#).

If neither a hash match (group or individual), nor an exact match occur, then if promiscuous mode is enabled (FEC\_RCR[PROM] = 1), the frame is accepted and the MISS bit in the receive buffer descriptor is set. Otherwise, the frame is rejected.

Similarly, if the DA is a broadcast address, broadcast reject (FEC\_RCR[BC\_REJ]) is asserted, and promiscuous mode is enabled, then the frame is accepted and the MISS bit in the receive buffer descriptor is set. Otherwise, the frame is rejected.

In general, when a frame is rejected, it is flushed from the FIFO.

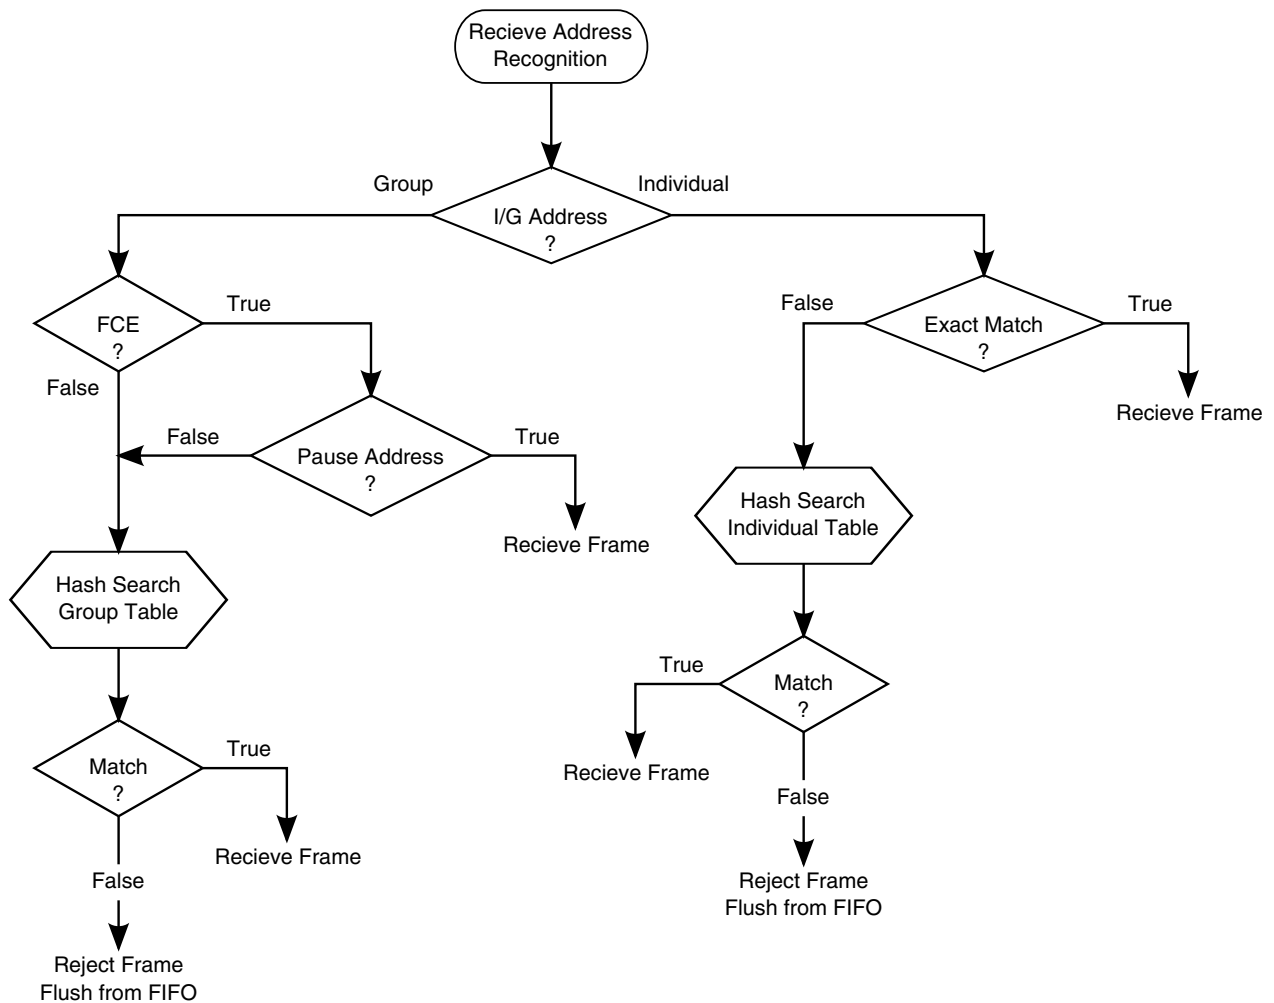

## NOTES:

BC\_REJ - Field in RCR register (BroadCast REject)

PROM-Field in RCR register (PROMiscuous mode)

Pause Frame - Valid PAUSE frame received

**Figure 24-2. Ethernet Address Recognition-Receive Block Decisions**

## NOTES:

FCE - field in RCR register (Flow Control Enable)

I/G - Individual/Group bit in Destination Address (least significant bit in first byte received in MAC frame)

**Figure 24-3. Ethernet Address Recognition-Microcode Decisions****24.5.3.2.1 Hash Algorithm**

The hash table algorithm used in the group and individual hash filtering operates as follows. The 48-bit destination address is mapped into one of 64 bits, which are represented by 64 bits stored in FEC\_GAUR, FEC\_GALR (group address hash match) or FEC\_IAUR, FEC\_IALR (individual address hash match). This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63. The MSB of the CRC result selects FEC\_GAUR (MSB = 1) or FEC\_GALR (MSB = 0). The least significant five bits of the hash result select the bit within the selected register. If the CRC generator selects a bit that is set in the hash table, the frame is accepted; otherwise, it is rejected. For example, if eight group addresses are stored in the hash table

and random group addresses are received, the hash table prevents roughly 56/64 (87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The hash table registers must be initialized by the user. The CRC32 polynomial to use in computing the hash is shown in the following equation:

$$X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$

Table 24-5 shows example destination addresses and corresponding hash values is included below for reference.

**Table 24-5. Destination Address to 6-Bit Hash**

### 24.5.3.3 Reception Error Handling

The Ethernet controller reports frame reception error conditions using the FEC RxBDs, the FEC\_EIR register, and the MIB counters.

There are five types of reception errors:

- Overrun
- Non-octet (dribbling bits)
- CRC
- Frame-length violation
- Truncation

These are described in the following subsections.

#### 24.5.3.3.1 Overrun

If the receive block has data to put into the receive FIFO and the receive FIFO is full, the FEC sets the OV bit in the RxBD. All subsequent data in the frame is discarded, and subsequent frames can also be discarded until the receive FIFO is serviced by the DMA and space is made available. At this point the receive frame/status word is written into the FIFO with the OV bit set. This frame must be discarded by the driver.

#### 24.5.3.3.2 Non-Octet (Dribbling Bits)

The Ethernet controller handles up to seven dribbling bits when the receive frame terminates past a non-octet aligned boundary. Dribbling bits are not used in the CRC calculation. If there is a CRC error, then the frame non-octet aligned (NO) error is reported in the RxBD. If there is no CRC error, then no error is reported.

### 24.5.3.3.3 CRC

When a CRC error occurs with no dribble bits, the FEC closes the buffer and sets the CR bit in the RxBD. CRC checking cannot be disabled, but the CRC error can be ignored if checking is not required.

### 24.5.3.3.4 Frame Length Violation

When the receive frame length exceeds MAX\_FL bytes the BABR interrupt is generated, and the LG bit in the end of frame RxBD is set. The frame is not truncated unless the frame length exceeds 2047 bytes).

### 24.5.3.3.5 Truncation

When the receive frame length exceeds 2047 bytes, the frame is truncated and the TR bit is set in the RxBD.

## 24.5.4 Full-Duplex Flow Control

Full-duplex flow control allows the user to transmit pause frames and to detect received pause frames.

Upon detection of a pause frame, FEC data frame transmission stops for a given pause duration.

To enable pause frame detection, the FEC must operate in full-duplex mode (FEC\_TCR[FDEN] asserted) and flow control enable (FEC\_RCR[FCE]) must be asserted. The FEC detects a pause frame when the fields of the incoming frame match the pause frame specifications, as shown in [Table 24-6](#). In addition, the receive status associated with the frame indicates that the frame is valid.

**Table 24-6. Pause Frame Field Specification**

48-bit destination address	0x0180_C200_0001 or physical address
48-bit source address	Any
16-bit type	0x8808
16-bit opcode	0x0001
16-bit pause duration	0x0000-0xFFFF

Pause frame detection is performed by the receiver and microcontroller modules. The microcontroller runs an address recognition subroutine to detect the specified pause frame destination address, while the receiver detects the type and opcode pause frame

fields. On detection of a pause frame, FEC\_TCR[GTS] is asserted by the FEC internally. When transmission has paused, the FEC\_EIR[GRA] interrupt is asserted and the pause timer begins to increment.

### NOTE

The pause timer makes use of the transmit backoff timer hardware, which is used for tracking the appropriate collision backoff time in half-duplex mode. The pause timer increments after every slot time, until FEC\_OPD[PAUSE\_DUR] slot times have expired.

On FEC\_OPD[PAUSE\_DUR] expiration, FEC\_TCR[GTS] is cleared allowing FEC data frame transmission to resume.

### NOTE

The receive flow control pause (FEC\_TCR[RFC\_PAUSE]) status bit is asserted while the transmitter is paused due to reception of a pause frame.

To transmit a pause frame, the FEC must operate in full-duplex mode and the user must assert flow control pause (FEC\_TCR[TFC\_PAUSE]). On assertion of transmit flow control pause (FEC\_TCR[TFC\_PAUSE]), the transmitter asserts FEC\_TCR[GTS] internally. When the transmission of data frames stops, the FEC\_EIR[GRA] (graceful stop complete) interrupt asserts. Following FEC\_EIR[GRA] assertion, the pause frame is transmitted. On completion of pause frame transmission, flow control pause (FEC\_TCR[TFC\_PAUSE]) and FEC\_TCR[GTS] are cleared internally.

The user must specify the desired pause duration in the FEC\_OPD register.

### NOTE

When the transmitter is paused due to receiver/microcontroller pause frame detection, transmit flow control pause (FEC\_TCR[TFC\_PAUSE]) still can be asserted and causes the transmission of a single pause frame. In this case, the FEC\_EIR[GRA] interrupt is not asserted.

## 24.5.5 Internal and External Loopback

Both internal and external loopback are supported by the Ethernet controller. In loopback mode, both of the FIFOs are used and the FEC actually operates in a full-duplex fashion. Both internal and external loopback are configured using combinations of the LOOP and

DRT bits in the FEC\_RCR register, the FDEN bit in the FEC\_TCR register and the LBMODE bit in FEC\_MIIGSK\_CFGR register. Furthermore internal loopback has two levels which loops data back in MII domain and RMII domain respectively.

For both internal and external loopback set FDEN = 1 and FEC\_RCR[DRT] = 0.

For the MII domain internal loopback set FEC\_RCR[LOOP] = 1 and FEC\_MIIGSK\_CFGR[LBMODE] = 0. FEC\_TX\_EN and FEC\_TX\_ER will not assert during internal loopback. During the MII domain internal loopback, the transmit/receive data rate is higher than in normal operation because the internal system clock is used by the transmit and receive blocks instead of the clocks from the external transceiver. This will cause an increase in the required system bus bandwidth for transmit and receive data being DMA'd to/from external memory. It may be necessary to pace the frames on the transmit side and/or limit the size of the frames to prevent transmit FIFO underrun and receive FIFO overflow.

For the RMII domain internal loopback, set FEC\_RCR[LOOP] = 0 and FEC\_MIIGSK\_CFGR[LBMODE] = 1. The data is sent from the MII domain into MIIGSK, converted to RMII format by a RMII transmitter inside the MIIGSK, then looped back through a RMII receiver of the MIIGSK, finally gets back to the MII domain.

For external loopback set FEC\_RCR[LOOP] = 0, FEC\_MIIGSK\_CFGR[LBMODE] = 0, and configure the external transceiver for loopback.

## **24.6 Initialization/Application Information**

### **24.6.1 Initialization Sequence**

This section describes which registers are reset due to hardware reset, which are reset by the FEC RISC, and what locations the user must initialize prior to enabling the FEC.

#### **24.6.1.1 Hardware Controlled Initialization**

In the FEC, registers and control logic that generate interrupts are reset by hardware. A hardware reset negates output signals and resets general configuration bits.

Other registers are reset when the FEC\_ECR[ETHER\_EN] bit is cleared, as indicated in [Table 24-7](#). FEC\_ECR[ETHER\_EN] is cleared by a hard reset or can be cleared by software to halt operation. By clearing FEC\_ECR[ETHER\_EN], the configuration control registers such as the FEC\_TCR and FEC\_RCR do not reset, but the entire data path resets.

**Table 24-7. Effect on FEC of Clearing FEC\_ECR[ETHER\_EN]**

Register/Machine	Reset Value
XMIT block	Transmission is aborted (bad CRC appended)
RECV block	Receive activity is aborted
DMA block	All DMA activity is terminated
FEC_RDAR	Cleared
FEC_TDAR	Cleared
Descriptor Controller block	Halt operation
MIIGSK	Interface to transceiver is disabled

### 24.6.1.2 User Initialization (Prior to Asserting FEC\_ECR[ETHER\_EN])

The user must initialize portions of the FEC prior to setting the FEC\_ECR[ETHER\_EN] bit. The exact values depend on the particular application. The order of initializations is not important except those that are explicitly mentioned.

The FEC and FEC FIFO/DMA registers which require initialization are defined in [Table 24-8](#).

**Table 24-8. Registers Requiring Initialization before Setting FEC\_ECR[ETHER\_EN]**

Register	Location (FEC or FIFO/DMA)	Comments
FEC_EIMR	FEC	Requires initialization
FEC_EIR	FEC	Must be cleared by writing 0xFFFF_FFFF
FEC_TFWR	FEC	Optional
FEC_IALR / FEC_IAUR	FEC	-
FEC_GAUR / FEC_GALR	FEC	-
FEC_PALR / FEC_PAUR	FEC	-
FEC_OPD	FEC	Only needed for full-duplex flow control
FEC_RCR	FEC	-
FEC_TCR	FEC	-
FEC_MSCR	FEC	Optional

*Table continues on the next page...*

**Table 24-8. Registers Requiring Initialization before Setting FEC\_ECR[ETHER\_EN]  
(continued)**

Register	Location (FEC or FIFO/DMA)	Comments
FEC_MIIGSK_CFGR	FEC	Must be configured before setting FEC_MIIGSK_ENR[EN]
FEC_MIIGSK_ENR	FEC	EN bit must be set
MIB counters	FEC	Must be cleared
FEC_FRSR	FIFO/DMA	Initialization is optional
FEC_EMRR	FIFO/DMA	-
FEC_ERDSR	FIFO/DMA	-
FEC_ETDSR	FIFO/DMA	-
Transmit Descriptor ring	FIFO/DMA	Must be emptied
Receive Descriptor ring	FIFO/DMA	Must be emptied

### 24.6.1.3 Microcontroller Initialization

In the FEC, the descriptor control RISC initializes some registers after FEC\_ECR[ETHER\_EN] is asserted. After the microcontroller initialization sequence is complete, the hardware is ready for operation.

The microcontroller initialization sequence follows:

1. Initialize BackOff Random Number Seed
2. Activate Receiver
3. Activate Transmitter
4. Clear Transmit FIFO
5. Clear Receive FIFO
6. Initialize Transmit Ring Pointer
7. Initialize Receive Ring Pointer
8. Initialize FIFO Count Register

### 24.6.1.4 User Initialization (after asserting FEC\_ECR[ETHER\_EN])

After asserting FEC\_ECR[ETHER\_EN], the user can set up the buffer/frame descriptors and write to the FEC\_TDAR and FEC\_RDAR. See [Buffer Descriptors](#) for more details.

## 24.6.2 Buffer Descriptors

This section provides a description of the operation of the driver/DMA through the buffer descriptors (BD).

It is followed by a detailed description of the receive and transmit descriptor fields.

### 24.6.2.1 Driver/DMA Operation with Buffer Descriptors

The data for the FEC frames must reside in memory external to the FEC. The data for a frame is placed in one or more buffers. Associated with each buffer is a buffer descriptor (BD) which contains a starting address (pointer), data length, and status/control information (which contains the current state for the buffer). To permit maximum user flexibility, the BDs are also located in external memory and are read in by the FEC DMA engine.

Software "produces" buffers by allocating/initializing memory and initializing buffer descriptors. Setting the RxBD[E] or TxBD[R] bit "produces" the buffer. Software writing to either the FEC\_TDAR or FEC\_RDAR tells the FEC that a buffer has been placed in external memory for the transmit or receive data traffic, respectively. The hardware reads the BDs and "consumes" the buffers after they have been produced. After the data DMA is complete and the buffer descriptor status bits have been written by the DMA engine, the RxBD[E] or TxBD[R] bit is cleared by hardware to signal the buffer has been "consumed." Software can poll the BDs to detect when the buffers have been consumed or can rely on the buffer/frame interrupts. These buffers can then be processed by the driver and returned to the free list.

The FEC\_ECR[ETHER\_EN] signal operates as a reset to the BD/DMA logic. When FEC\_ECR[ETHER\_EN] is cleared the DMA engine BD pointers are reset to point to the starting transmit and receive BDs. The buffer descriptors are not initialized by hardware during reset. At least one transmit and receive buffer descriptor must be initialized by software before the FEC\_ECR[ETHER\_EN] bit is set.

The buffer descriptors operate as two separate rings. FEC\_ERDSR defines the starting address for receive BDs and FEC\_ETDSR defines the starting address for transmit BDs. The last buffer descriptor in each ring is defined by the Wrap (W) bit. When set, W indicates that the next descriptor in the ring is at the location pointed to by FEC\_ERDSR and FEC\_ETDSR for the receive and transmit rings, respectively.

#### NOTE

Buffer descriptor rings must start on a 128-bit boundary.

## 24.6.2.2 Ethernet Transmit Buffer Descriptor (TxBd)

Table 24-9 shows the transmit buffer descriptor format. Table 24-10 describes the TxBd fields.

Status bits for the buffer/frame are not included in the transmit buffer descriptors. Transmit frame status is indicated by individual interrupt bits (error conditions) and in statistic counters in the MIB block. See Message Information Block (MIB) Counters Memory Map, for more details.

**Table 24-9. Transmit Buffer Descriptor (TxBd)**

Offset	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0004	Tx Data Buffer Pointer A[31:16]															
	Tx Data Buffer Pointer A[15:0]															

**Table 24-10. Transmit Buffer Descriptor Field Definitions**

Offset	Field	Description
0x0000	31 R	Ready. Written by the FEC and the user.  0 The data buffer associated with this BD is not ready for transmission. The user is free to manipulate this BD or its associated data buffer. The FEC clears this bit after the buffer has been transmitted or after an error condition is encountered.  1 The data buffer, which has been prepared for transmission by the user, has not been transmitted or is currently being transmitted. No fields of this BD can be written by the user after this bit is set.
0x0000	30 TO1	Transmit software ownership. This field is reserved for software use. This read/write bit is not modified by hardware, nor does its value affect hardware.
0x0000	29 W	Wrap. Written by user.  0 The next buffer descriptor is found in the consecutive location  1 The next buffer descriptor is found at the location defined in FEC_ETDSR.
0x0000	28 TO2	Transmit software ownership. This field is reserved for use by software. This read/write bit is not modified by hardware, nor does its value affect hardware.
0x0000	27 L	Last in frame. Written by user.  0 The buffer is not the last in the transmit frame.  1 The buffer is the last in the transmit frame.
0x0000	26 TC	Tx CRC. Written by user (only valid if L = 1).  0 End transmission immediately after the last data byte.  1 Transmit the CRC sequence after the last data byte.
0x0000	25 ABC	Append bad CRC. Written by user (only valid if L = 1).  0 No effect  1 Transmit the CRC sequence inverted after the last data byte (regardless of TC value).

*Table continues on the next page...*

**Table 24-10. Transmit Buffer Descriptor Field Definitions (continued)**

Offset	Field	Description
0x0000	15-0 Data Length	Data Length, written by user. Data length is the number of octets the FEC transmits from this BD's data buffer. It is never modified by the FEC. Bits [10:0] are used by the DMA engine, bits[15:11] are ignored.
0x0004	31-0 A	Tx data buffer pointer <sup>1</sup>

1. The transmit buffer pointer, which contains the address of the associated data buffer, must always be divisible by 16. The buffer must reside in memory external to the FEC. This value is never modified by the Ethernet controller.

### 24.6.2.2.1 Driver/DMA Operation with Transmit Buffer Descriptors

Data is presented to the FEC for transmission by arranging it in buffers referenced by the channel's TxBDs. After the software driver has set up the buffers for a frame, it sets up the corresponding BDs. In the TxBD the user initializes the R, W, L, and TC bits and the length (in bytes) in the first longword, and the buffer pointer in the second longword. The last step in setting up the BDs for a transmit frame is to set the R bit in the first BD for the frame. The driver follows that with a write to FEC\_TDAR which triggers the FEC to poll the next BD in the ring.

The Ethernet controller confirms transmission by clearing the ready bit (R bit) when DMA of the buffer is complete.

#### 24.6.2.2.1.1 Transmit Frame in Multiple Buffers

Typically a transmit frame is divided between multiple buffers. For example, it is possible to have an application payload in one buffer, TCP header in a 2nd buffer, IP header in a 3rd buffer, and Ethernet/IEEE 802.3 header in a 4th buffer. The FEC does not prepend the Ethernet header (Destination Address, Source Address, Length/Type field(s)), so this must be provided by the driver in one of the transmit buffers. The FEC or the driver can append the Ethernet CRC to the frame. The driver must set the TC bit in the transmit BD to determine whether the CRC is appended by the FEC or by the driver.

The driver (TxBD software producer) sets up Tx BDs in such a way that a complete transmit frame is given to the hardware at once. If a transmit frame consists of three buffers, first the BD's are initialized with pointer, length and control (W, L, TC, ABC) and then the TxBD[R] bits are set to 1 in *reverse order* (3rd, 2nd, 1st BD) to insure that the complete frame is ready in memory before the DMA begins. If the TxBDs are set up in order, the DMA controller could DMA the first BD before the 2nd was made available, potentially causing a transmit FIFO underrun.

In the FEC, the DMA is notified by the driver that new transmit frame(s) are available by writing to the FEC\_TDAR register. When this register is written to (data value is not significant) the FEC RISC tells the DMA to read the next transmit BD in the ring. After started, the RISC + DMA continues to read and interpret transmit BDs in order and DMA the associated buffers, until a transmit BD is encountered with the R bit = 0. At this point the FEC polls this BD one more time. If the R bit = 0 the second time, then the RISC stops the transmit descriptor read process until software sets up another transmit frame and writes to FEC\_TDAR.

When the DMA of each transmit buffer is complete, the DMA writes back to the BD to clear the R bit, indicating that the hardware consumer is finished with the buffer.

### 24.6.2.3 Ethernet Receive Buffer Descriptor (RxBD)

**Table 24-11. Receive Buffer Descriptor (RxBD)**

Offset	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0004	Rx Data Buffer Pointer A[31:16]															
	Rx Data Buffer Pointer A[15:0]															

**Table 24-12. Receive Buffer Descriptor Field Definitions**

Offset	Field	Description
0x0000	31 E	Empty. Written by the FEC (=0) and user (=1).  0 The data buffer associated with this BD has been filled with received data, or data reception has been aborted due to an error condition. The status and length fields have been updated as required.  1 The data buffer associated with this BD is empty, or reception is currently in progress.
0x0000	30 RO1	Receive software ownership.  This field is reserved for use by software. This read/write bit is not modified by hardware, nor does its value affect hardware.
0x0000	29 W	Wrap. Written by user.  0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in FEC_ERDSR.
0x0000	28 RO2	Receive software ownership.  This field is reserved for use by software. This read/write bit is not modified by hardware, nor does its value affect hardware.
0x0000	27 L	Last in frame. Written by the FEC.  0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
0x0000	25	Reserved.

*Table continues on the next page...*

**Table 24-12. Receive Buffer Descriptor Field Definitions (continued)**

Offset	Field	Description
0x0000	24 M	Miss. Written by the FEC. This bit is set by the FEC for frames that were accepted in promiscuous mode, but were flagged as a "miss" by the internal address recognition. Thus, while in promiscuous mode, the user can use the M-bit to quickly determine whether the frame was destined to this station. This bit is valid only if the L-bit is set and the PROM bit is set.  0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode.
0x0000	23 BC	Set if the DA is broadcast (FF:FF:FF:FF:FF:FF).
0x0000	22 MC	Set if the DA is multicast and not BC.
0x0000	21 LG	Rx frame length violation. Written by the FEC. A frame length greater than FEC_RCR[MAX_FL] was recognized. This bit is valid only if the L-bit is set. The receive data is not altered in any way unless the length exceeds 2047 bytes.
0x0000	20 NO	Receive non-octet aligned frame. Written by the FEC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error. This bit is valid only if the L-bit is set. If this bit is set the CR bit is not set.
0x0000	19	Reserved
0x0000	18 CR	Receive CRC error. Written by the FEC. This frame contains a CRC error and is an integral number of octets in length. This bit is valid only if the L-bit is set.
0x0000	17 OV	Overflow. Written by the FEC. A receive FIFO overflow occurred during frame reception. If this bit is set, the other status bits, M, LG, NO, CR, and CL lose their normal meaning and is zero. This bit is valid only if the L-bit is set.
0x0000	16 TR	Set if the receive frame is truncated (frame length > 2047 bytes). If the TR bit is set the frame is discarded and the other error bits ignored as they can be incorrect.
0x0000	15-0 Data Length	Data length. Written by the FEC. Data length is the number of octets written by the FEC into this BD's data buffer if L = 0 (the value is equal to FEC_EMRBR), or the length of the frame including CRC if L = 1. It is written by the FEC once as the BD is closed.
0x0004	31-0	RX data buffer pointer <sup>1</sup>

1. The receive buffer pointer, which contains the address of the associated data buffer, must always be divisible by 16. The buffer must reside in memory external to the FEC. This value is never modified by the Ethernet controller.

### 24.6.2.3.1 Driver/DMA Operation with Receive Buffer Descriptors

Unlike the transmit case, the length of the receive frame is unknown by the driver ahead of time. Therefore the driver must set a variable to define the length of all receive buffers. In the FEC, this variable is written to the FEC\_EMRBR register.

The driver (RxBD software producer) sets up some number of "empty" buffers for the Ethernet by initializing the address field and the E and W bits of the associated receive BDs. The hardware (receive DMA) consumes these buffers by filling them with data as frames are received, and clearing the E bit and writing to the L bit (1 indicates last buffer in frame), the frame status bits (if L = 1) and the length field.

If a receive frame spans multiple receive buffers, the L bit is only set for the last buffer in the frame. For non-last buffers, the length field in the receive BD is written by the DMA (at the same time the E bit is cleared) with the default receive buffer length value. For end of frame buffers, the L=1 bit is set in the receive BD, and information written to the status bits (M, BC, MC, LG, NO, CR, OV, TR). Some of the status bits are error indicators which, if set, indicate the receive frame is discarded and not given to higher layers. The frame status/length information is written into the receive FIFO following the end of the frame (as a single 32-bit word) by the receive logic. The length field for the end of frame buffer is written with the length of the entire frame, not just the length of the last buffer.

For simplicity the driver can assign the default receive buffer length to be large enough to contain an entire frame, keeping in mind that a malfunction on the network or out-of-specification implementation could result in giant frames. Frames of 2 Kbytes (2048 bytes) or larger are truncated by the FEC at 2047 bytes, so software never sees a receive frame larger than 2047 bytes.

As in the transmit case, the FEC polls the receive descriptor ring after the driver sets up receive BDs and writes to the FEC\_RDAR register. As frames are received the FEC fills receive buffers and update the associated BDs, then reads the next BD in the receive descriptor ring. If the FEC reads a receive BD and finds the E bit is cleared, it polls this BD once more. If E is still cleared, then the FEC stops reading receive BDs until the driver writes to FEC\_RDAR.

### NOTE

Whenever the software driver sets an E bit in one or more receive descriptors, the driver follows that with a write to FEC\_RDAR.

## 24.7 Programmable Registers

### 24.7.1 Top Level Block Memory Map

The FEC implementation requires a 1 Kbyte memory space. This space is divided into 2 sections of 512 bytes each. The first is used for control/status registers, and the second contains event/statistics counters held in the MIB block.

[Table 24-13](#) defines the top level memory map. For the base address of a particular block instantiation, see the system memory map.

**Table 24-13. Block Memory Map**

Base Address Offset	Function
0x0000-01FF	Control/Status Registers
0x0200-02FF	MIB Block Counters
0x0300-03FF	Extension Registers (MIIGSK)

## 24.7.2 Message Information Block (MIB) Counters Memory Map

Table 24-14 shows the MIB counters memory map, which defines the locations in the MIB RAM space where hardware maintained counters reside. It is the responsibility of software to poll the counters often enough to ensure that rollover is detected. For example, on a 100 Mbps channel an octets counter could roll over every 5.7 minutes.

These counters fall in the 0x0200-0x03FF address offset range, and are divided into RMON counters and IEEE counters, as follows:

- RMON counters are included which cover the Ethernet statistics counters defined in RFC 1757. In addition to the counters defined in the Ethernet statistics group, a counter is included to count truncated frames as the FEC only supports frame lengths up to 2047 bytes. The RMON counters are implemented independently for transmit and receive to insure accurate network statistics when operating in full-duplex mode.
- IEEE counters are included which support the mandatory and recommended counter packages defined in section 5 of ANSI/IEEE Std. 802.3 (1998 edition). The IEEE basic package objects are supported by the FEC but do not require counters in the MIB block. In addition, some of the recommended package objects which are supported do not require MIB counters. Counters for transmit and receive full-duplex flow control frames are included as well.

**Table 24-14. MIB Counters Memory Map**

Base Address Offset	Mnemonic	Description
0x0200	RMON_T_DROP	Count of frames not counted correctly
0x0204	RMON_T_PACKETS	RMON Tx packet count
0x0208	RMON_T_BC_PKT	RMON Tx broadcast packets
0x020C	RMON_T_MC_PKT	RMON Tx multicast packets
0x0210	RMON_T_CRC_ALIGN	RMON Tx packets w CRC/Align error
0x0214	RMON_T_UNDERSIZE	RMON Tx packets < 64 bytes, good crc
0x0218	RMON_T_OVERSIZE	RMON Tx packets > MAX_FL bytes, good crc
0x021C	RMON_T_FRAG	RMON Tx packets < 64 bytes, bad crc
0x0220	RMON_T_JAB	RMON Tx packets > MAX_FL bytes, bad crc

*Table continues on the next page...*

**Table 24-14. MIB Counters Memory Map (continued)**

Base Address Offset	Mnemonic	Description
0x0224	RMON_T_COL	RMON Tx collision count
0x0228	RMON_T_P64	RMON Tx 64 byte packets
0x022C	RMON_T_P65TO127	RMON Tx 65 to 127 byte packets
0x0230	RMON_T_P128TO255	RMON Tx 128 to 255 byte packets
0x0234	RMON_T_P256TO511	RMON Tx 256 to 511 byte packets
0x0238	RMON_T_P512TO1023	RMON Tx 512 to 1023 byte packets
0x023C	RMON_T_P1024TO2047	RMON Tx 1024 to 2047 byte packets
0x0240	RMON_T_P_GTE2048	RMON Tx packets w > 2048 bytes
0x0244	RMON_T_OCTETS	RMON Tx octets
0x0248	IEEE_T_DROP	Count of frames not counted correctly
0x024C	IEEE_T_FRAME_OK	Frames transmitted OK
0x0250	IEEE_T_1COL	Frames transmitted with single collision
0x0254	IEEE_T_MCOL	Frames transmitted with multiple collisions

### 24.7.3 MIIGSK Registers Memory Map

**Table 24-15. MIIGSK Registers Memory Map**

Offset	Mnemonic	Description
0x0300	FEC_MIIGSK_CFGR	MIIGSK Configuration Register
0x0308	FEC_MIIGSK_ENR	MIIGSK Enable Register

## 24.8 FEC Memory Map/Register Definition

This section includes the FEC memory map and detailed descriptions of all the registers, followed by a description of the buffers.

The FEC is programmed by a combination of control and status registers (FEC\_CSRs) and buffer descriptors. The FEC\_CSRs are used for mode control and to extract global status information. The descriptors are used to pass data buffers and related buffer information between the hardware and software.

The FEC implementation requires a 1 Kbyte memory space. This space is divided into 2 sections of 512 bytes each. The first is used for control/status registers, and the second contains event/statistics counters held in the MIB block.

Table defines the top level memory map. For the base address of a particular block instantiation, see the system memory map.

**Table 24-17. Block Memory Map**

Base Address Offset	Function
---------------------	----------

*Table continues on the next page...*

**Table 24-17. Block Memory Map (continued)**

0x0000-01FF	Control/Status Registers
0x0200-02FF	MIB Block Counters
0x0300-03FF	Extension Registers (MIIGSK)

The following table shows the FEC register memory map. For the base address of a particular block instantiation, see the system memory map.

**FEC memory map**

<b>Absolute address (hex)</b>	<b>Register name</b>	<b>Width (in bits)</b>	<b>Access</b>	<b>Reset value</b>	<b>Section/page</b>

*Table continues on the next page...*

**FEC memory map (continued)**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_8184	Transmit buffer descriptor ring start register (FEC_ETDSR)	32	R/W	0000_0000h	<a href="#">24.8.22/1102</a>
218_8188	Maximum receive buffer size register (FEC_EMRR)	32	R/W	0000_0000h	<a href="#">24.8.23/1102</a>

**24.8.1 Ethernet interrupt event register (FEC\_EIR)**

The FEC\_EIR bit assignments are shown below. When an event occurs that sets a bit in the FEC\_EIR, an interrupt is generated if the corresponding bit in the interrupt mask register (FEC\_EIMR) is also set. The bit in the FEC\_EIR is cleared if a one is written to that bit position; writing zero has no effect. This register is cleared upon hardware reset.

Interrupts can be divided into three classes as follows:

- Interrupts that occur in normal operation: these include GRA, TXF, TXB, RXF, RXB, and MII.
- Interrupts that result from errors or problems detected in the network or transceiver: these include HBERR, BABR, BABT, LC, and RL.
- Interrupts that result from internal errors are EBERR and UN.

Some of the error interrupts are independently counted in the MIB block counters. The correspondence between interrupts and counters is shown in the following table. Software can choose to mask off the interrupts because these errors are visible to network management through the MIB counters.

**Table 24-19. Error Interrupts and Block Counters**

Interrupt	Counter(s)
HBERR	IEEE_T_SQE
BABR	RMON_R_OVERSIZE (good CRC), RMON_R_JAB (bad CRC)
BABT	RMON_T_OVERSIZE (good CRC), RMON_T_JAB (bad CRC)
LATE_COL	IEEE_T_LCOL
COL_RETRY_LIM	IEEE_T_EXCOL
XFIFO_UN	IEEE_T_MACERR

## FEC Memory Map/Register Definition

### FEC\_EIR field descriptions

Field	Description
31 HBERR	Heartbeat error. This interrupt indicates that HBC is set in the FEC_TCR register and that the COL input was not asserted within the Heartbeat window following a transmission.
30 BABR	Babbling receive error. This bit indicates a frame was received with length in excess of FEC_RCR[MAX_FL] bytes.
29 BABT	Babbling transmit error. This bit indicates that the transmitted frame length has exceeded FEC_RCR[MAX_FL] bytes. This condition is usually caused by a frame that is too long being placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful stop complete. This interrupt is asserted for one of three reasons. Graceful stop means that the transmitter is put into a pause state after completion of the frame currently being transmitted. 1) A graceful stop, which was initiated by the setting of the FEC_TCR[GTS] bit is now complete. 2) A graceful stop, which was initiated by the setting of the FEC_TCR[TFC_PAUSE] bit is now complete. 3) A graceful stop, which was initiated by the reception of a valid full-duplex flow control "pause" frame is now complete. See the "Full-Duplex Flow Control" section of the Functional Description chapter.
27 TXF	Transmit frame interrupt. This bit indicates that a frame has been transmitted and that the last corresponding buffer descriptor has been updated.
26 TXB	Transmit buffer interrupt. This bit indicates that a transmit buffer descriptor has been updated.
25 RXF	Receive frame interrupt. This bit indicates that a frame has been received and that the last corresponding buffer descriptor has been updated.
24 RXB	Receive buffer interrupt. This bit indicates that a receive buffer descriptor has been updated that was not the last in the frame.
23 MII	MII interrupt. This bit indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet bus error. This bit indicates that a system bus error occurred when a DMA transaction was underway. When the EBERR bit is set, FEC_ECR[ETHER_EN] is cleared, halting frame processing by the FEC_. When this occurs software needs to insure that the FIFO controller and DMA are also soft reset.
21 LC	Late collision. This bit indicates that a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame is truncated with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision retry limit. This bit indicates that a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. Can only occur in half-duplex mode.

Table continues on the next page...

**FEC\_EIR field descriptions (continued)**

Field	Description
19 UN	Transmit FIFO underrun. This bit indicates that the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded.
18–0 -	This field is reserved. Reserved, read as 0

**24.8.2 Ethernet interrupt mask register (FEC\_EIMR)**

The FEC\_EIMR controls which of the interrupt events flagged in the FEC\_EIR are allowed to generate actual interrupts. If the corresponding bits in both the FEC\_EIR and FEC\_EIMR are set, the interrupt is signaled to the ARM platform. The interrupt signal remains asserted until a 1 is written to the FEC\_EIR bit (write 1 to clear) or a 0 is written to the FEC\_EIMR bit. This register is cleared upon a hardware reset.

The FEC\_EIMR bit assignments are the same as for the FEC\_EIR.

18–0 Reserved	This read-only field is reserved and always has the value 0.

### 24.8.3 Receive descriptor active register (FEC\_RDAR)

FEC\_RDAR is a user-writeable command register which indicates that the receive descriptor ring has been updated, and that empty receive buffers have been produced by the driver with the empty bit in RxBD set.

The FEC\_RDAR[R\_DES\_ACTIVE] bit is set whenever the register is written, independent of the data actually written by the user. When it is set, the FEC polls the receive descriptor ring and processes receive frames (provided FEC\_ECR[ETHER\_EN] is also set to 1). After the FEC finds a receive descriptor whose empty bit is not set, the FEC clears the FEC\_RDAR[R\_DES\_ACTIVE] bit and ceases the polling in the receive descriptor ring until the user sets the bit again to sign the availability of additional descriptors in the receive descriptor ring.

The FEC\_RDAR is cleared when FEC\_ECR[ETHER\_EN] is cleared or system is reset.

Address: 218\_8000h base + 10h offset = 218\_8010h

FEC\_RDAR field descriptions

Field	Description
31–25 -	This field is reserved. Reserved, read as 0
24 R_DES_ACTIVE	Set to one when this register is written, regardless of the value written. Cleared by the FEC device when the FEC finds a receive descriptor whose empty bit is not set. Also cleared when FEC_ECR[ETHER_EN] is cleared.
23–0 -	This field is reserved. Reserved, read as 0

## 24.8.4 Transmit descriptor active register (FEC\_TDAR)

The FEC\_TDAR is a command register, which is written by the user, to indicate that the transmit descriptor ring has been updated (transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor).

Whenever the register is written, the FEC\_TDAR[X\_DES\_ACTIVE] bit is set to 1, independent of the data actually written by the user. When set, the FEC polls the transmit descriptor ring and process transmit frames (provided FEC\_ECR[ETHER\_EN] is also set to 1). After the FEC finds a transmit descriptor whose ready bit is not set, then the FEC clears the FEC\_TDAR[X\_DES\_ACTIVE] bit and ceases transmit descriptor ring polling until the user sets the bit again, the transmit descriptor ring.

The FEC\_TDAR is cleared, when FEC\_ECR[ETHER\_EN] is cleared, or when FEC\_ECR[RESET] is set to 1 or system is reset.

Address: 218\_8000h base + 14h offset = 218\_8014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**FEC\_TDAR field descriptions**

Field	Description
31–25 -	This field is reserved. Reserved, read as 0
24 X_DES_ACTIVE	Set to one when this register is written, regardless of the value written. Cleared by the FEC device when the FEC finds a transmit descriptor whose ready bit is not set. Also cleared when FEC_ECR[ETHER_EN] is cleared.
23–0 -	This field is reserved. Reserved, read as 0

24.8.5 Ethernet control register (FEC\_ECR)

The ECR is used to enable/disable the FEC\_ECR which is a read/write user register, though both fields in this register can also be altered by hardware.

Address: 218\_8000h base + 24h offset = 218\_8024h

FEC\_ECR field descriptions

Field	Description
31–2 -	This field is reserved. Reserved.
1 ETHER_EN	When this bit is set, the FEC is enabled, and reception and transmission are possible. When this bit is cleared, reception is immediately stopped and transmission is stopped after a bad CRC is appended to any currently transmitted frame. The buffer descriptor(s) for an aborted transmit frame are not updated after clearing this bit. When ETHER_EN is cleared, the DMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. The ETHER_EN bit is altered by hardware under the following conditions:  FEC_ECR[RESET] is set by software, in which case ETHER_EN is cleared  an error condition causes the FEC_EIR[EBERR] bit to set, in which case ETHER_EN is cleared
0 RESET	When this bit is set, the equivalent of a hardware reset is performed but it is local to the FEC, ETHER_EN is cleared and all other FEC registers take their reset values. Also, any transmission/reception currently in progress is abruptly aborted. This bit is automatically cleared by hardware during the reset sequence. The reset sequence takes approximately 8 system clock cycles after RESET is written with a 1.

### 24.8.6 MII management frame register (FEC\_MMFR)

The FEC\_MMFR is used to communicate with the attached MII compatible PHY device(s) by providing read/write access to their MII registers. Performing a write to FEC\_MMFR causes a management frame to be generated unless the MII-SPEED field of the FEC\_MSCR has been set to 0. MII frame is generated with the data previously written to FEC\_MMFR. This allows FEC\_MMFR and FEC\_MSCR to be programmed in any order if the MII-SPEED field of FEC\_MSCR is zero (for further details see [MII speed control register \(FEC\\_MSCR\)](#) ).

The FEC\_MMFR does not reset to a definite value.

To perform a read or write operation on the MII Management Interface, the FEC\_MMFR must be written by the user. To generate a valid read or write management frame, the ST field must be written with a 01 pattern, and the TA field must be written with a 10 pattern. If other patterns are written to these fields, a frame is generated but does not comply with the IEEE 802.3 MII definition.

To generate an IEEE 802.3-compliant MII management interface write frame (write to a PHY register), the user must write {01 01 PHYAD REGAD 10 DATA} to the bit fields of the FEC\_MMFR, as shown in [MII management frame register \(FEC\\_MMFR\)](#) , causes the control logic to shift out the data in the FEC\_MMFR following a preamble generated by the control state machine. During this time, the contents of the FEC\_MMFR is altering as the contents are serially shifted so the value is unpredictable if it is read by the user. After the write management frame operation has completed, the MII interrupt is generated. At this time, the contents of the FEC\_MMFR matches to the original value written.

To generate an MII management interface read frame (read a PHY register) the user must write {01 10 PHYAD REGAD 10 XXXX} to the bit fields of the FEC\_MMFR shown in [MII management frame register \(FEC\\_MMFR\)](#) (the contents of the 4-bit DATA field are arbitrary). This causes the control logic to shift out the data in the FEC\_MMFR following a preamble generated by the control state machine. During this time, the contents of the FEC\_MMFR is altering as the contents are serially shifted to the register value, it is unpredictable if it is read by the user. After the read management frame operation has completed, the MII interrupt is generated. At this time the contents of the FEC\_MMFR matches to the original value written except for the DATA field whose contents have been replaced by the value read from the PHY register.

If the FEC\_MMFR is written during the progress of frame greneration, the frame contents is altered. Thus software should use the MII interrupt to avoid writing to the FEC\_MMFR while frame generation is in progress.

## FEC Memory Map/Register Definition

Address: 218\_8000h base + 40h offset = 218\_8040h

\* Notes:

- u = Unaffected by reset.

## FEC\_MMFR field descriptions

Field	Description
31–30 ST	Start of frame delimiter. These bits must be programmed to 01 for a valid MII management frame.
29–28 OP	Operation code. This field must be programmed to 10 (read) or 01 (write) to generate a valid MII management frame. A value of 11 produces "read" frame operation while a value of 00 produces "write" frame operation, but these frames is not MII compliant.
27–23 PA	PHY address. This field specifies one of up to 32 attached PHY devices.
22–18 RA	Register address. This field specifies one of up to 32 registers within the specified PHY device.
17–16 TA	Turn around. This field must be programmed to 10 to generate a valid MII management frame.
15–0 DATA	Management frame data. This is the field for data to be written to or read from the PHY register.

## 24.8.7 MII speed control register (FEC\_MSCR)

The FEC\_MSCR provides control of the frequency of the MII clock (FEC\_MDC signal), and allows a preamble drop on the MII management frame .

The MII\_SPEED field must be programmed with a value to generate an FEC\_MDC frequency which is less than or equal to 2.5 MHz so that it is compliant with the IEEE 802.3 MII specification. The MII\_SPEED must be set to a non-zero value in order to generate a read or write management frame. After the management frame is completed, the FEC\_MSCR can optionally be set to zero in order to turn off the FEC\_MDC. The FEC\_MDC frequency has a 50% duty cycle except when MII\_SPEED is changed during operation (change takes effect following either a rising or falling edge of FEC\_MDC).

The FEC\_MDC frequency depends on both the system clock frequency and the MII\_SPEED register. If the system clock is 25 MHz, programming the MII\_SPEED register to 0x0000\_0005 results in an FEC\_MDC frequency of  $25 \text{ MHz} * 1/10 = 2.5 \text{ MHz}$ . A table showing optimum values for MII\_SPEED at different system clock frequencies is provided below.

**Table 24-26. Programming Examples for FEC\_MSCR**

System Clock Frequency	MII_SPEED (field in reg)	FEC_MDC frequency
25 MHz	0x5	2.5 MHz
33 MHz	0x7	2.36 MHz
40 MHz	0x8	2.5 MHz
50 MHz	0xA	2.5 MHz
66 MHz	0xD	2.54 MHz

Address: 218\_8000h base + 44h offset = 218\_8044h

**FEC\_MSCR field descriptions**

Field	Description
31–8 -	This field is reserved. Reserved, read as 0
7 DIS_PREAMBLE	Asserting this bit causes preamble (0xFFFF_FFFF) not to be prepended to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY device(s) does not require it.
6–1 MII_SPEED	MII_SPEED controls the frequency of the MII management interface clock (FEC_MDC) relative to the system clock. A value of 0 in this field "turns off" the FEC_MDC and leave it in low voltage state. Any non-zero value results in the FEC_MDC frequency of 1/(MII_SPEED*2) of the system clock frequency.
0 -	This field is reserved. Reserved, read as 0

24.8.8 MIB control register (FEC\_MIBC)

The MIB control register is a read/write register which is used to provide control of and to observe the state of the Message Information Block (MIB). This register is accessed by user software if there is a need to disable the MIB operation. For example, the user wants to clear all MIB counters in RAM. the user disables the MIB, then clears all the MIB RAM locations, then enables the MIB. The reset value of MIB\_DISABLE bit is 1. See [Table 24-14](#) for the locations of the MIB counters.

Address: 218\_8000h base + 64h offset = 218\_8064h

**FEC\_MIBC field descriptions**

Field	Description
31 MIB_DISABLE	A read/write control bit. If set, the MIB logic halts and does not update any MIB counters.
30 MB_IDLE	A read-only status bit. If set, the MIB block is not currently updating any MIB counters.
29–0 -	This field is reserved. Reserved.

**24.8.9 Receive control register (FEC\_RCR)**

The FEC\_RCR is programmed by the user, and controls the operational mode of the receive block. It can only be written when FEC\_ECR[ETHER\_EN] = 0 (that is, during initialization).

Address: 218\_8000h base + 84h offset = 218\_8084h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved					MAX_FL										
W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved										FCE		BC_REJ	PROM	MII_MODE	DRT
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**FEC\_RCR field descriptions**

Field	Description
31–27 -	This field is reserved. Reserved, read as 0
26–16 MAX_FL	Maximum frame length. Resets to decimal 1518. Length is measured from DA and up to the CRC at the end of the frame. Transmit frames longer than MAX_FL causes the BABT interrupt to occur. Receive Frames longer than MAX_FL causes the BABR interrupt to occur and sets the LG bit in the last frame receive buffer descriptor. The recommended default value to be programmed by the user is 1518 or 1522 (if VLAN Tags are supported).
15–6 -	This field is reserved. Reserved, read as 0
5 FCE	Flow control enable. When FCE is set to 1, the receiver detects pause frames. Upon pause frame detection, the transmitter stops transmitting data frames for a given duration.

Table continues on the next page...

**FEC\_RCR field descriptions (continued)**

Field	Description
4 BC_REJ	Broadcast frame reject. When BC_REJ is set to 1, frames with DA (destination address) = 0xFF_FF_FF_FF_FF_FF are rejected unless the PROM bit is set to 1. If both BC_REJ and PROM are set to 1, then frames with broadcast DA is accepted and the M (MISS) bit is set in the receive buffer descriptor.
3 PROM	Promiscuous mode. All frames are accepted regardless of address matching.
2 MII_MODE	Media independent interface mode. Setting this bit to 1 selects MII mode, setting this bit equal to 1 selects 7-wire mode (used only for serial 10 Mbps). This bit controls the external interface mode for both transmit and receive blocks.
1 DRT	Disable receive on transmit. 0 Receive path operates independently of transmit (use for full-duplex or to monitor transmit activity in half-duplex mode). 1 Disable reception of frames while transmitting (normally used for half-duplex mode).
0 LOOP	Internal loopback. When LOOP is set to 1, transmitted frames are looped back internal to the device and the transmit output signals are not asserted. The system clock is substituted for the FEC_TX_CLK when LOOP is set to 1. DRT must be set to 0 when setting LOOP to 1.

## 24.8.10 Transmit control register (FEC\_TCR)

This register is read/write register which is written by the user to configure the transmit block. Bits [2:1] must only be modified when FEC\_ECR[ETHER\_EN] = 0 (that is, during initialization). This register is cleared at system reset.

Address: 218\_8000h base + C4h offset = 218\_80C4h

**FEC\_TCR field descriptions**

Field	Description
31–5 -	This field is reserved. Reserved read as 0
4 RFC_PAUSE	Receive frame control pause. This read-only status bit is set to 1 when a full-duplex flow control pause frame has been received and the transmitter is paused for the duration defined in this pause frame. This bit automatically clears when the pause duration is complete.

*Table continues on the next page...*

**FEC\_TCR field descriptions (continued)**

Field	Description
	0 Transmitter is not paused 1 Transmitter is paused after reception of full-duplex flow control pause frame
3 TFC_PAUSE	Transmit frame control pause. When this bit is set to 1, a pause frame is transmitted according to the following steps: <ol style="list-style-type: none"> <li>1. FEC stops transmission of data frames after the current transmission is complete.</li> <li>2. The GRA interrupt in the FEC_EIR register is asserted.</li> <li>3. With transmission of data frames stopped, the FEC transmits a MAC control pause frame.</li> <li>4. The FEC clears the TFC_PAUSE bit and resume transmitting data frames.</li> </ol> The FEC can still transmit a MAC control pause frame when the transmitter is paused due to user assertion of GTS or reception of a pause frame. 0 No pause frame is transmitted 1 Pause frame is transmitted
2 FDEN	Full duplex enable. When FDEN is set to 1, frames are transmitted independent of carrier sense and collision inputs. This bit must only be modified when ETHER_EN is cleared. 0 Full duplex is not enabled 1 Full duplex is enabled
1 HBC	Heartbeat control. When HBC is set to 1, the heartbeat check is performed after end of transmission and the HB bit in the status register is set if the collision input does not assert within the heartbeat window. This bit must only be modified when ETHER_EN is cleared. 0 Heartbeat check is not performed after end of transmission 1 Heartbeat check is performed after end of transmission
0 GTS	Graceful transmit stop. When GTS is set to 1, the FEC stops transmission after any frame that is currently being transmitted is completed and the GRA interrupt in the FEC_EIR register is asserted. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission has completed, a "restart" can be accomplished by clearing the GTS bit. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS = 1, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There can be old frames in the transmit FIFO that is transmitted when GTS is reasserted. To avoid this, clear FEC_ECR[ETHER_EN] following the GRA interrupt. 0 Graceful transmit stop is not enabled 1 Graceful transmit stop is enabled.

### 24.8.11 Physical address low register (FEC\_PALR)

The FEC\_PALR, which is written by the user, contains the lower 32 bits (bytes 0,1,2,3) of the 48-bit address used in the address recognition process to check for possible match between the DA field of receive frames and an individual DA. This register is also used for bytes 0 through 3 of the 6-byte source address field when transmitting pause frames. This register is unaffected by reset and must be initialized by the user.

Address: 218\_8000h base + E4h offset = 218\_80E4h

#### FEC\_PALR field descriptions

Field	Description
31–0 PADDR1	Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8) and 3 (bits 7:0) of the 6-byte individual address to be used for exact match, and the source address field in pause frames.

### 24.8.12 Physical address upper register (FEC\_PAUR)

The FEC\_PAUR, which is written by the user, and contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to check for possible match between the DA field of receive frames and an individual DA. In addition, this register is used in bytes 4 and 5 of the 6-byte source address field when transmitting pause frames. Bits 15:0 of FEC\_PAUR are a constant type field (0x8808) which is used for transmission of pause frames. This register is unaffected by reset, and bits 31:16 must be initialized by the user.

Address: 218\_8000h base + E8h offset = 218\_80E8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**FEC\_PAUR field descriptions**

Field	Description
31–16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address to be used for exact match, and the source address field in pause frames.
15–0 TYPE	Type field in pause frames. This field has a constant value of 0x8808.

**24.8.13 Opcode and pause duration register (FEC\_OPDR)**

FEC\_OPDR contains the 16-bit Opcode, and 16-bit pause duration fields used in transmission of a pause frame. The Opcode field is a constant value, 0x0001. When another node detects a pause frame, that node pauses transmission for the duration specified in the pause duration field. This register is not reset and must be initialized by the user.

Address: 218\_8000h base + ECh offset = 218\_80ECh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**FEC\_OPDR field descriptions**

Field	Description
31–16 OPCODE	Opcode field used in pause frames. These bits are a constant, 0x0001.
15–0 PAUSE_DUR	Pause duration field used in pause frames.

### 24.8.14 Descriptor individual address upper register (FEC\_IAUR)

The FEC\_IAUR, which is written by the user, contains the upper 32 bits of the 64-bit individual address hash table used in the address recognition process to check for possible match between the DA field of receive frames and an individual DA. This register is unaffected by reset, and must be initialized by the user.

Address: 218\_8000h base + 118h offset = 218\_8118h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### FEC\_IAUR field descriptions

Field	Description
31–0 IADDR1	The upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR1 contains hash index bit 63. Bit 0 of IADDR1 contains hash index bit 32.

### 24.8.15 Descriptor individual address lower register (FEC\_IALR)

The FEC\_IALR, which is written by the user, contains the lower 32 bits of the 64-bit individual address hash table used in the address recognition process to check for possible match with the DA field of receive frames with an individual DA. This register is unaffected by reset, and must be initialized by the user.

Address: 218\_8000h base + 11Ch offset = 218\_811Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### FEC\_IALR field descriptions

Field	Description
31–0 IADDR2	The lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0.

## 24.8.16 Descriptor group address upper register (FEC\_GAUR)

The FEC\_GAUR, which is written by the user, contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. This register must be initialized by the user.

Address: 218\_8000h base + 120h offset = 218\_8120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### FEC\_GAUR field descriptions

Field	Description
31–0 GADDR1	The GADDR1 register contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32.

## 24.8.17 Descriptor group address lower register (FEC\_GALR)

The FEC\_GALR, which is written by the user, contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. This register must be initialized by the user.

Address: 218\_8000h base + 124h offset = 218\_8124h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### FEC\_GALR field descriptions

Field	Description
31–0 GADDR2	The GADDR2 register contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

## 24.8.18 Transmit FIFO watermark register (FEC\_TFWR)

The FEC\_TFWR is programmed by the user to control the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows the user to minimize transmit latency (FEC\_TFWR[1:0] = 0x *n* ) or allow for larger bus access latency (FEC\_TFWR[1:0] = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. In some use cases the byte counts associated with the FEC\_TFWR field need to be modified to match system requirements, such as the worst-case bus access latency by the transmit data DMA channel.

Address: 218\_8000h base + 144h offset = 218\_8144h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### FEC\_TFWR field descriptions

Field	Description
31–2 -	This field is reserved. Reserved, read as 0
1–0 X_WMRK	Number of bytes written to transmit FIFO before transmission of a frame begins  0x 64 bytes written 10 128 bytes written 11 192 bytes written

24.8.19 FIFO receive bound register (FEC\_FRBR)

The FEC\_FRBR register can be read to determine the upper address bound of the FIFO RAM. Drivers can use this value, along with the FEC\_FRSR to appropriately divide the available FIFO RAM between the transmit and receive data paths.

Address: 218\_8000h base + 14Ch offset = 218\_814Ch

FEC\_FRBR field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–2 R_BOUND	Read-only. Highest valid FIFO RAM address.
1–0 Reserved	This read-only field is reserved and always has the value 0.

24.8.20 FIFO receive FIFO start registers (FEC\_FRSR)

FEC\_FRSR is an 8-bit register programmed by the user to indicate the starting address of the receive FIFO. FEC\_FRSR marks the boundary between the transmit and receive FIFOs. The transmit FIFO uses addresses from the start of the FIFO to the location four bytes before the address programmed into the FEC\_FRSR. The receive FIFO uses the addresses from FEC\_FRSR to FEC\_FRBR inclusive.

The default value of the receive FIFO starting address is 0x40. This is the value assigned by hardware at reset.

Address: 218\_8000h base + 150h offset = 218\_8150h

**FEC\_FRSR field descriptions**

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–2 R_FSTART	Address of first receive FIFO location. Acts as delimiter between receive and transmit FIFOs.
1–0 Reserved	This read-only field is reserved and always has the value 0.

### 24.8.21 Receive buffer descriptor ring start register (FEC\_ERDSR)

The register, which is written by the user, provides a pointer to the start of the circular receive buffer descriptor queue in external memory. This pointer must be 128-bit aligned (that is, evenly divisible by 16).

This register is unaffected by reset and must be initialized by the user prior to operation.

Address: 218\_8000h base + 180h offset = 218\_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

\* Notes:

- u = Unaffected by reset.

**FEC\_ERDSR field descriptions**

Field	Description
31–2 R_DES_START	Pointer to start of receive buffer descriptor queue.
1–0 -	This field is reserved. Reserved, read as 0

## 24.8.22 Transmit buffer descriptor ring start register (FEC\_ETDSR)

The register, which is written by the user, provides a pointer to the start of the circular transmit buffer descriptor queue in external memory. This pointer must be 128-bit aligned (that is, evenly divisible by 16).

This register is unaffected by reset and must be initialized by the user prior to operation.

Address: 218\_8000h base + 184h offset = 218\_8184h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### FEC\_ETDSR field descriptions

Field	Description
31–2 X_DES_START	Pointer to start of transmit buffer descriptor queue.
1–0 -	This field is reserved. Reserved, read as 0

## 24.8.23 Maximum receive buffer size register (FEC\_EMRR)

The FEC\_EMRR is a user-programmable register which dictates the maximum size of all receive buffers. Note that receive frames is truncated at 2k-1(2047) bytes, so bits 31-11 are not used. The programmed value accounts for the fact that the receive CRC is always written into the last receive buffer. To allow one maximum size frame per buffer, FEC\_EMRR must be set to FEC\_RCR[MAX\_FL] or larger. The FEC\_EMRR must be evenly divisible by 16. To ensure this, bits 3-0 are forced to low, and hence only bits 10-4 are actually used. To minimize bus utilization (descriptor fetches), it is recommended that FEC\_EMRR must be greater than or equal to 256 bytes.

The FEC\_EMRR is unaffected by reset, and must be initialized by the user.

Address: 218\_8000h base + 188h offset = 218\_8188h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**FEC\_EMRR field descriptions**

Field	Description
31–11 -	This field is reserved. Reserved, is written to 0 by the host processor.
10–4 R_BUF_SIZE	Receive buffer size.
3–0 -	This field is reserved. Reserved, is written to 0 by the host processor.

# Chapter 25

## General Power Controller (GPC)

### 25.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- [DVFS - Dynamic Voltage & Frequency Scaling](#) load tracking for CPU
- [CPU Power Gating Control \(PGC\)](#)
- GPU and Display power gating controller

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

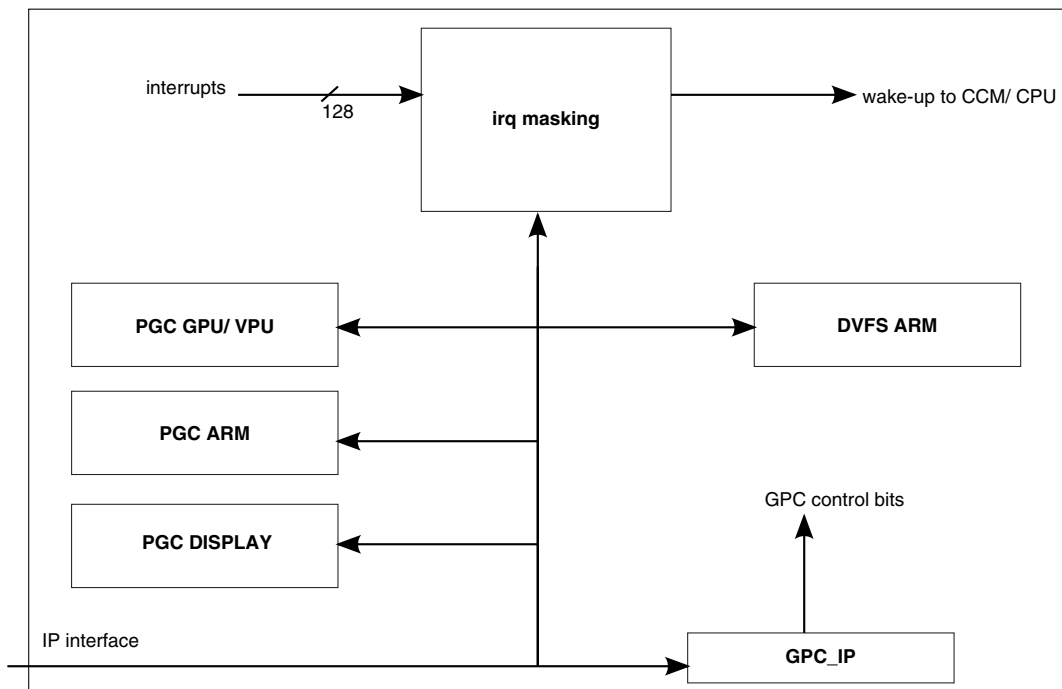

Figure 25-1. GPC Block Diagram

## 25.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 25-1. GPC Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

## 25.3 DVFS overview

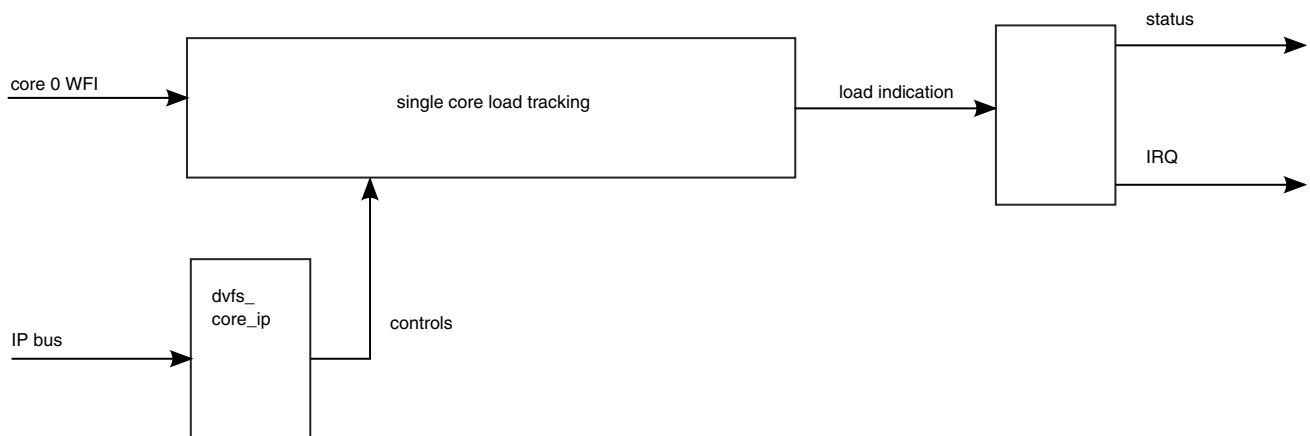

The DVFS allows simple dynamic voltage frequency scaling.

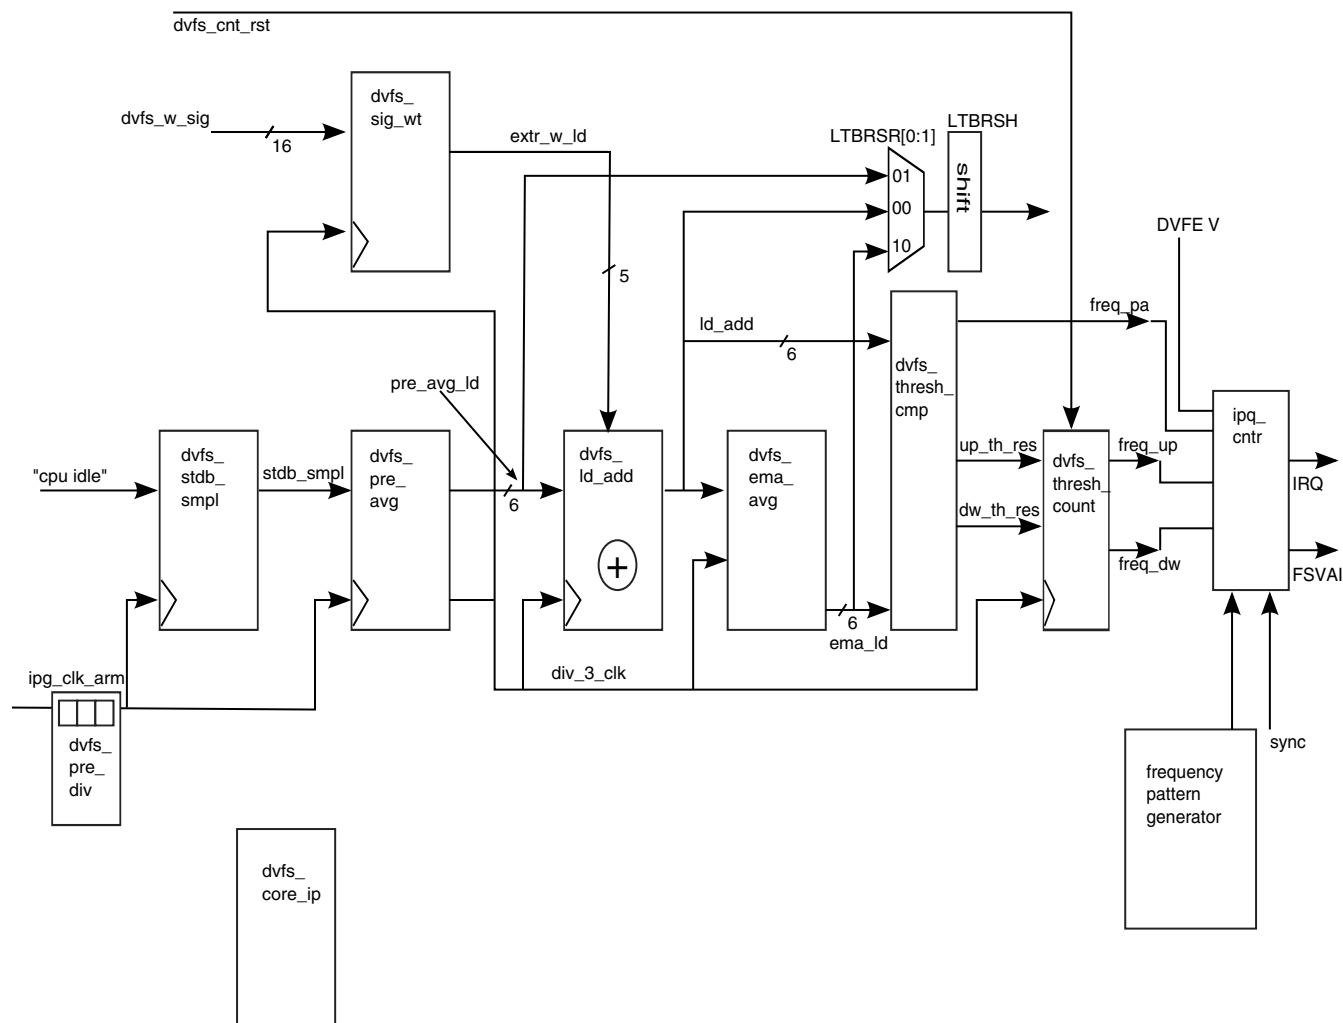

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporally switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

### NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

**Figure 25-2. DVFS\_core diagram**

**Figure 25-3. DVFS\_core: single core load tracking module**

### 25.3.1 Features

The DVFS load tracking block includes the following features:

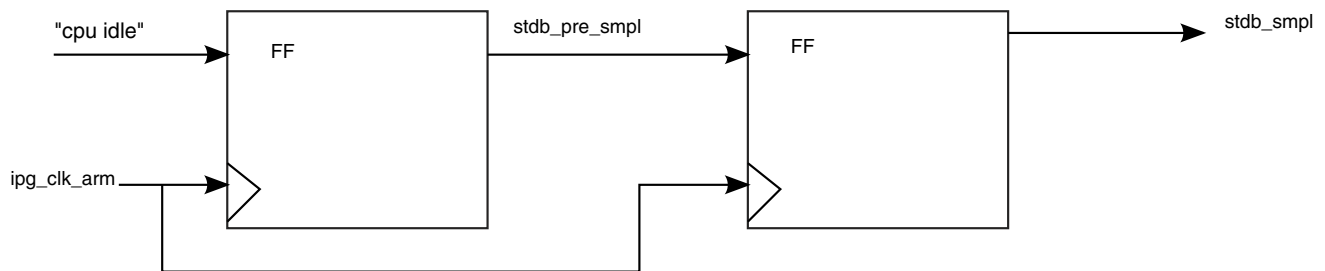

- Configurable include/exclude of input signals:
  - per-core ARM standby signal (idle / non-idle)
  - 16 general purpose bits (common for all 4 tracking modules)
    - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

## 25.4 Component Blocks description

### 25.4.1 dvfs\_stdb\_smpl block

This block samples the `ccm_arm_stdb` signal (ARM STANDBYWFI signal - idle state indicating) according to the edge of the `ipg_clk_arm` (ARM system clock) signal.

**Figure 25-4. dvfs\_stdb\_smpl block diagram**

This block synchronizes the `ccm_arm_stdb` signal with the `ipg_clk_arm` clock. The two signals enter the flip-flops twice and become synchronized. The resulting synchronized signal is `stdb_smpl`.

## 25.4.2 dvfs\_sig\_wt block

The purpose of this block is to sample the 16 GeP (general purpose) load signals, multiply each one of them by appropriate weight and sum products.

The sampling is done by the slow clock div\_3\_clk.

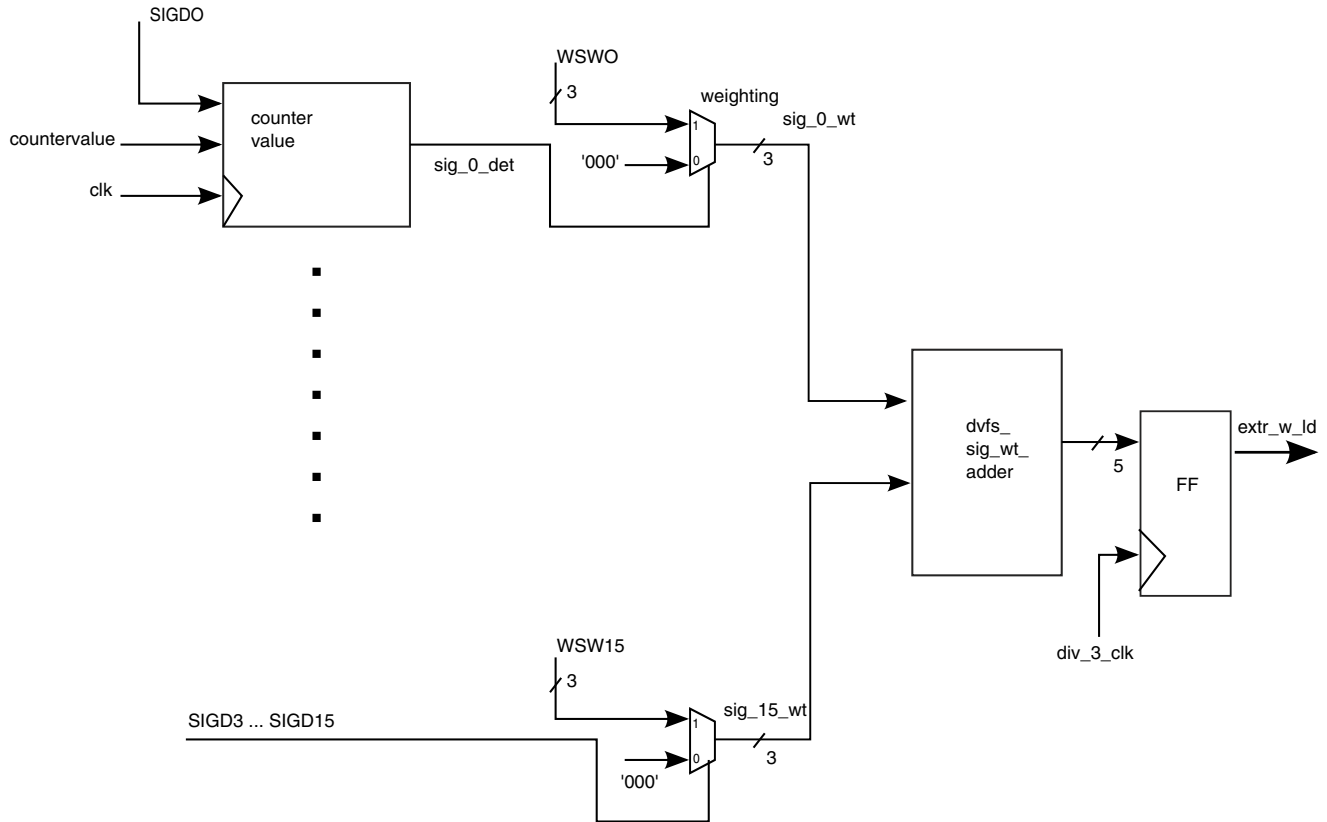

Figure 25-5. dvfs\_sig\_wt block diagram

## 25.4.3 dvfs\_pre\_avg block

The purpose of the dvfs\_pre\_avg block is to perform simple, non-overlapping averaging, reducing the sampling clock frequency and providing a level-based average index of the tracked CPU load.

External signals:

- stdb\_sampl - (input) sampled ARM standby signal
- ipg\_clk\_arm - (input) ARM system clk
- pre\_avg\_ld[4..0] - (output) averaged load
- div\_3\_clk - (output) clock, generated (reduced) from div\_2\_clk

- div\_2\_clk - (output) clock, generated (reduced) from div\_1\_clk
- div\_1\_clk - (output) clock, generated (reduced) from ipg\_clk\_arm

In the current implementation, the averaging is performed in three stages:

1. The first stage !IDLE is sampled by divided sys\_clock.
2. The second stage (counter 2) performs an averaging operation with constant parameters. The counter is a 9-bit adder whose output is sampled by the div\_2\_clk clock. The five highest bits of the sum\_2 signal are passed to counter 3 (equal to shift right operation).
3. The third (last) stage (counter 3) performs an averaging operation with configurable parameters, set by the DIV3CK. The counter 3 cell is a 15-bit adder with output sampled by div\_3\_clk. The Pre\_avg\_shifter\_5 cell passes configurable bits from the sum\_3 signal.

The output 5 bits avg\_load signal provides a result with a tolerance of ~3%. The supported values range is 0-0.97.

**Figure 25-6. dvfs\_pre\_avg block diagram**

**dvfs\_pre\_avg clocks****Figure 25-7. dvfs\_pre\_avg clocks**

The internal clocks in **dvfs\_avg\_pre** block are generated from **ipg\_clk\_arm**. The details are in the tables below. For **div\_3\_clk** averaging, see [DVFS Control \(DVFSC\\_CNTR\)](#) for more information.

**Table 25-2. dvfs\_pre\_avg signals and its values**

signal	binary max value	binary min value	decimal max value	decimal min value
sum_2	11111	0000	31	0
sum_3	111'1100'0000'0000	000'0000'0000'0000	31744	0
pre_avg_load	11111	0000	31	0

**Table 25-3. dvfs\_pre\_avg generated clocks**

clock name	generated from	ratio to source	ratio to ipg_clk_arm	max clk freq.	note
ipg_clk_arm	N/A	N/A	1	66MHz	source clock
div_1_clk	ipg_clk_arm	configurable	configurable	66MHz	configurable
div_2_clk (gated)	div_1_clk	512	configurable	128KHz	none
div_3_clk (gated)	div_2_clk	configurable	configurable	128KHz	configurable

### 25.4.4 dvfs\_ld\_add block

The dvfs\_ld\_add block sums the CPU load tracked by idle/non-idle signal slot, and the load detected from the additional load signals weighted by dvfs\_sig\_wt block.

The adder should perform the following operation:

$$\text{extr\_w\_ld}[4..0] + \{0, \text{pre\_avg\_ld}[4..0]\}$$

The input signals of five bits produce output signal of six bits, providing 3% resolution in the range of 0-1.97 of load indication. (1 is equal to 100% load tracking with no additional signals include.)

The output ld\_add[5..0] is sampled by div\_3\_clk signal.

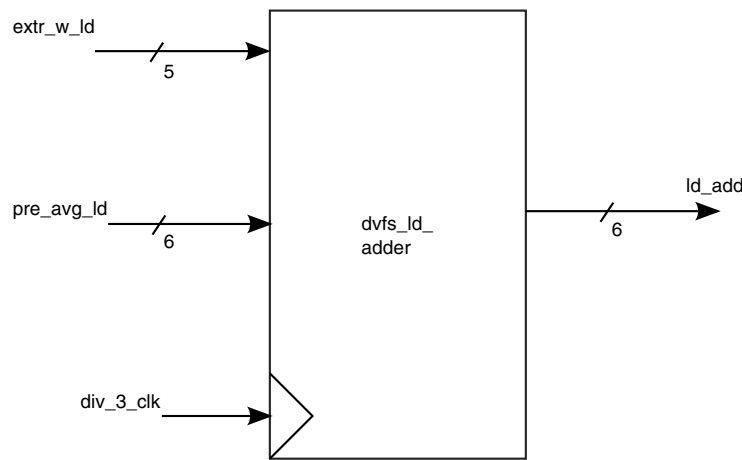

Figure 25-8. dvfs\_ld\_add block diagram

### 25.4.5 dvfs\_ema\_avg block

The purpose of dvfs\_ema\_avg (EMA - Exponential Moving Average) block is to calculate an exponential moving average of the tracked CPU load.

The parameters of EMA are defined by EMAC bits in DVFSEMAC. These parameters set how many samples of simple average will be taken into account.

The EMA formula is:  $\text{EMA}(i) = a \cdot X(i) + (1-a) \cdot \text{EMA}(i-1)$

where:

$$a = 2 / (N+1);$$

N is the number of samples taken into account.

X(i) = current input sample;

$EMA(i-1)$  = previous value of EMA.

By setting the value of "a", the behavior of EMA is defined.

In the following table, the parameter "a" is listed relatively to the amount of the X(i) samples taken into account ("N") in the equation above: (the resolution of the digital multiplier is limited, hence the lowest values of the "a" can be linked to a range of included samples in EMA instead of single number).

The following table also contains the amount of cycles in which the lower frequency will be masked from the moment that DVFS is enabled (and not between frequency switches), so that enough information about the history can be gained before the frequency is lowered.

**Table 25-4. EMA settings**

samples included in EMA calculatio n (N)	Number of cycles while lower frequency interrupt is masked	"a" value (decimal)	"a" value, adjusted by binary resolution	"a" value (binary)								
				bit 0	bit 1	bit 2	bit 3	bit 4	bit 5	bit 6	bit 7	bit 8

### dvfs\_ema\_avg block diagram

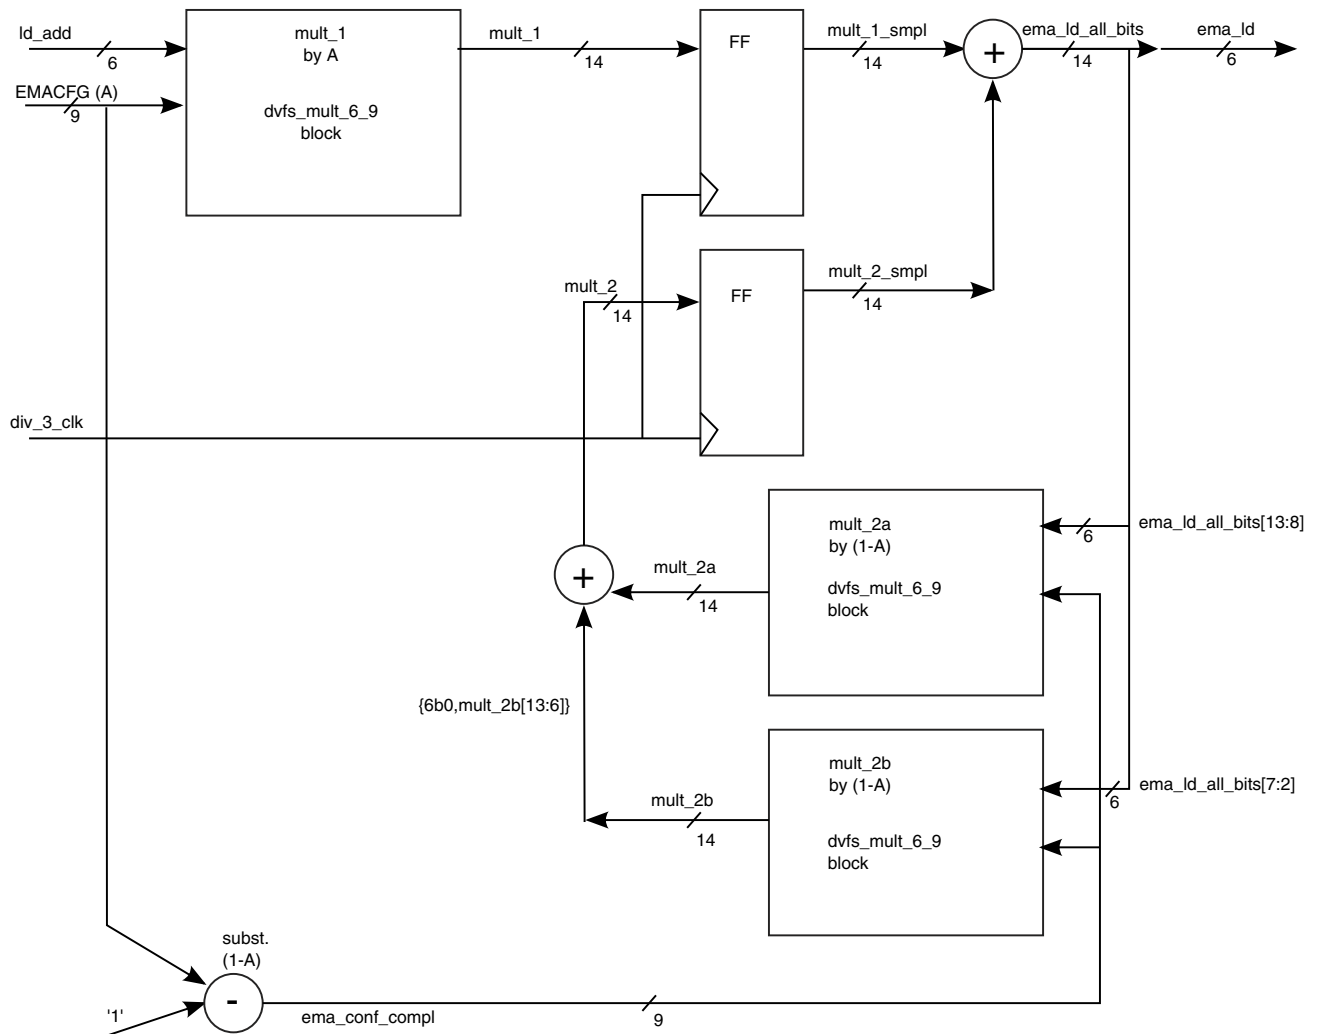

Figure 25-9. dvfs\_ema\_avg block diagram

The EMA block inputs are as follows:

- `ld_add[5..0]` - load level
- `EMACFG[8..0]` - "a" parameter of EMA algorithm
- `div_2_clk` - fast clock, not shown this in the diagram
- `div_3_clk` - slow clock

The EMA block outputs the following:

- `ema_ld[5..0]` - result of EMA algorithm (by `div_3_clk`)

The mult\_a block multiplies between comp\_load (6 bits) and EMACFG (9 bits). For the multiply operation, a faster clock (for internal sum) is required, which is provided by div\_2\_clk. Div\_2\_clk is faster than the div\_3\_clk by a factor of at least 16, which is enough for 6\*9 or 9\*6 operations. Only the highest six bits are taken from the result of mult\_a.

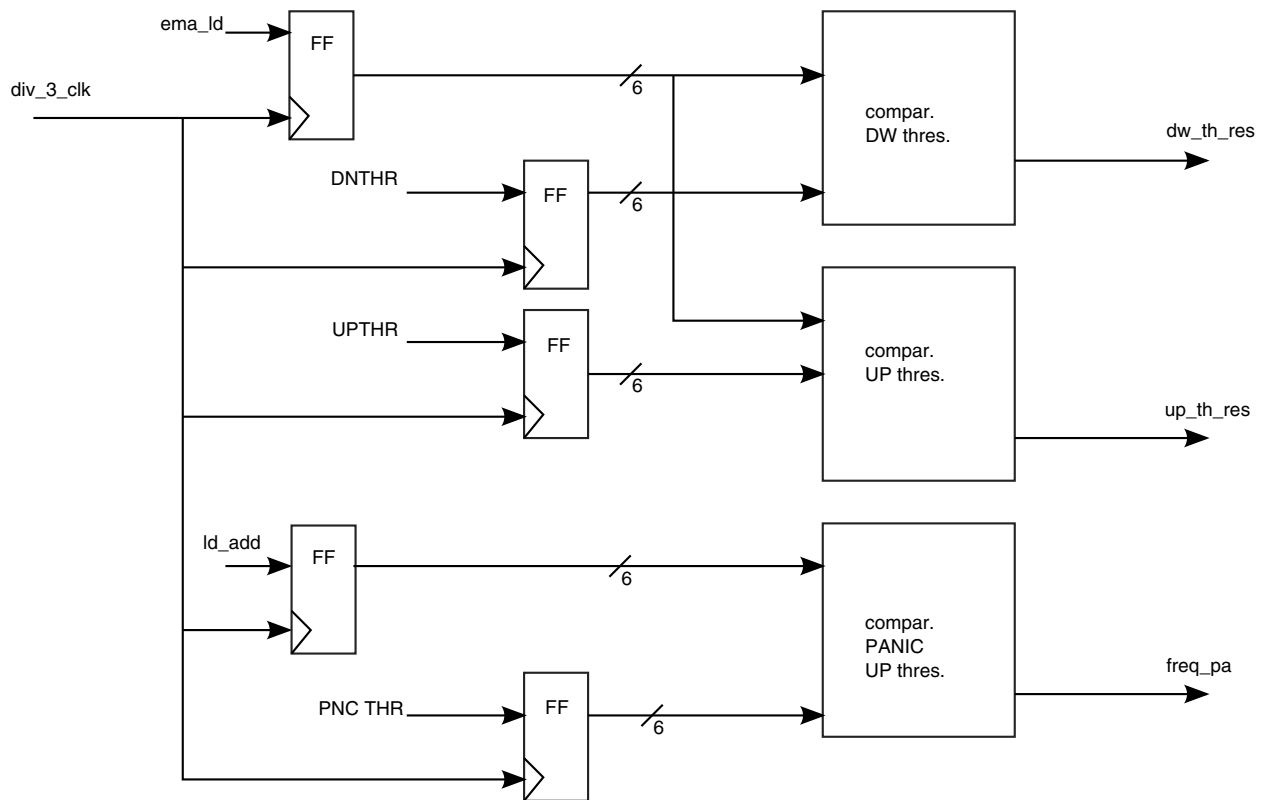

The mult\_b block operates in a similar manner.

The adder block's output is sampled with div\_3\_clk clock.

### 25.4.6 dvfs\_thres\_cmp block

The dvfs\_thres\_cmp block compares the CPU load value to programmable threshold levels.

The comparators as shown in the drawing below are used:

**Figure 25-10. dvfs\_tresh\_cmp diagram**

The block is composed of three (3) comparators:

1. compar\_dw\_thres comparator, which compares between ema\_ld signal (output of EMA block) and DNTHR signal (taken from config register, bits DNTHR).

2. compar\_up\_thres comparator, which compares between ema\_ld signal (output of EMA block) and UPTHR signal (taken from config register, bits UPTHR).
3. compar\_panic\_up\_thres comparator, which compares between ld\_add signal (output of load\_adder block) and PNCTHR signal (taken from config register, bits PNCTHR).

### **NOTE**

The current implementation of this block enables step-by-step down frequency change. For more advanced options, the number of the DW threshold comparators should be increased (up to three for four-level DVFS).

## **25.4.7 dvfs\_thresh\_count block**

The purpose of the dvfs\_thres\_count block is to count consecutive threshold overcomes of dw\_th\_res and up\_th\_res (outputs of threshold\_comp block).

If any of the counters (see the figure below) receives a null (zero) input synchronous with the clk3 signal, the counter is reset.

If the counter reaches a user defined value, its output is set to an active level. These counters are reset each time frequency scaling occurs or if the threshold overcomes are consecutive.

This block's output signals are saved in configuration register 0, bits [3,2].

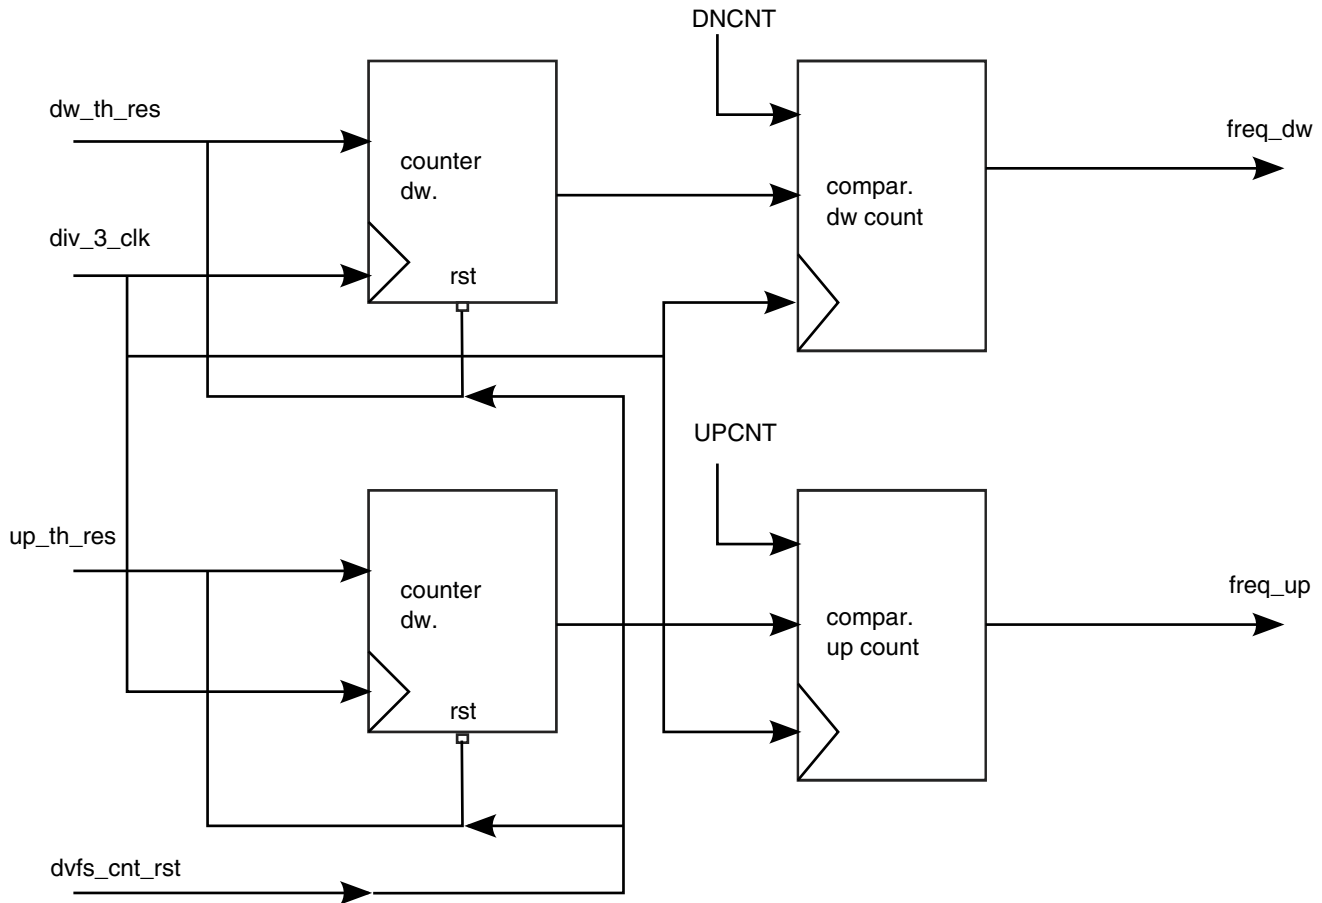

Figure 25-11. Thresh\_counters block diagram

### 25.4.8 Load Tracking Buffer Register

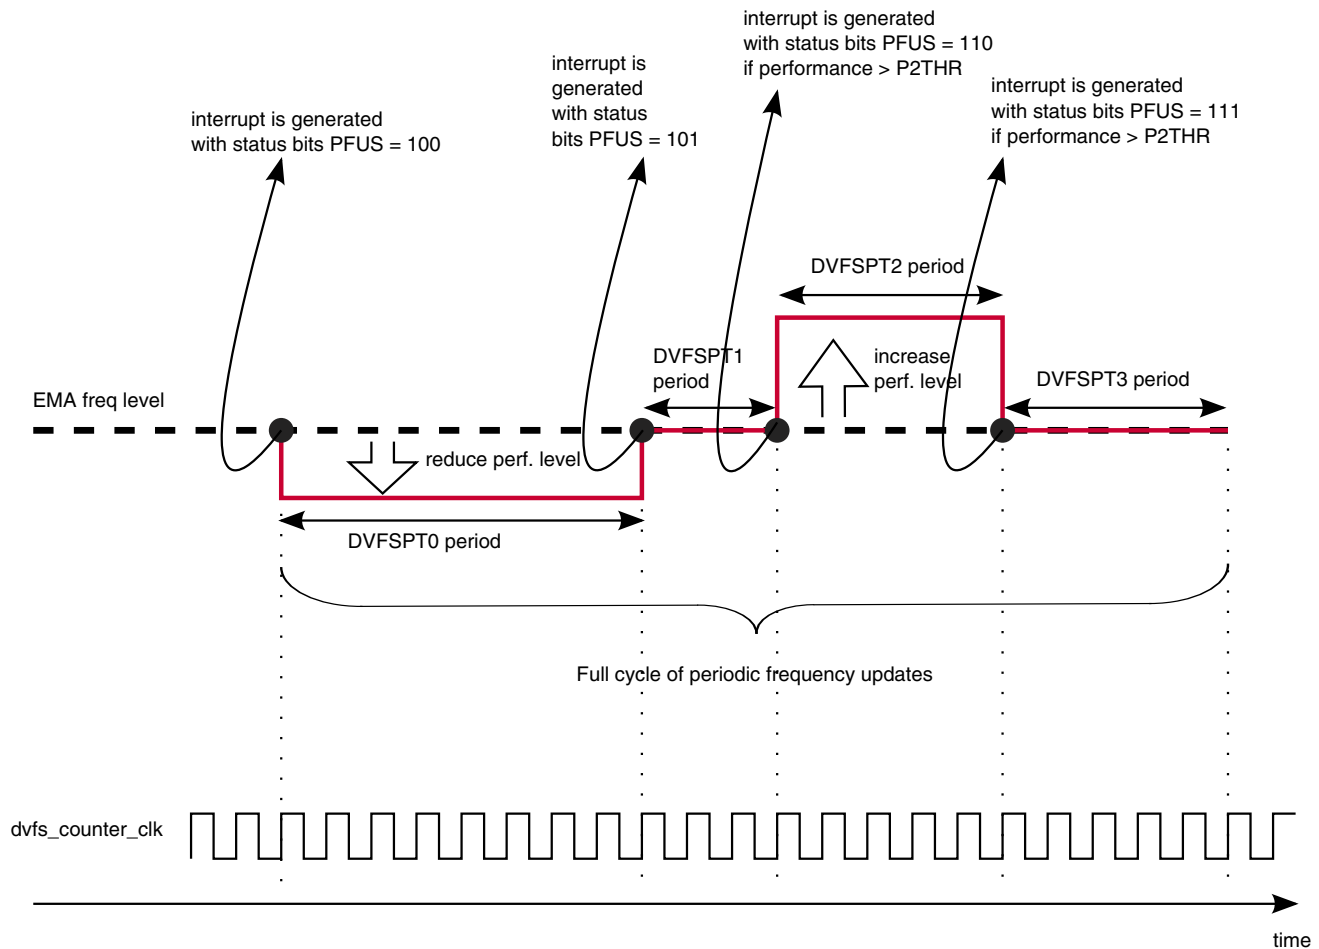

The purpose of the load tracking buffer register is to save last 16 samples of the tracked load (before EMA operation).

Hence, the 4 bits of `ld_add` signal (depending on the `LTBRSH`) are saved continuously, overwriting each time the latest sample. Each save is carried upon detecting an edge of the `div_3_clk` signal.

### 25.4.9 Frequency Pattern Generator

Frequency pattern generator is able to manage the frequency update requests periodically, additionally to main frequency update requests (if bit `FPUE` is set).

The periodic requests are created following the `DVFSPT0`, `DVFSPT1`, `DVFSPT2` and `DVFSPT3` register values, as described in the figure below.

**Figure 25-12. DVFS periodic frequency update requests**

In case that one of the DVFSPT0-DVFSPT3 period is set to "0", such frequency update will be skipped.

The periodic frequency update status is reflected in PFUS bits (reduce/increase performance request is an example - the actual steps taken upon period expiration are defined by s/w routine).

Dvfs\_counter\_clk is ckih divided 64:  $26\text{MHz}/64=0.40625\text{MHz}$ . The DVFSPT0, DVFSPT1, DVFSPT2 and DVFSPT3 counter are selected for 17 bits each to provide delay of  $2^{18}-1=262143$  counts, that are equal to 645ms. On the other hand, clk cycle of 0.40625MHz is  $\sim 2.46\mu\text{s}$ , that is fast enough to provide high resolution for frequency management for tasks.

The DVFSPT2 and DVFSPT3 interrupt generation is conditional upon current performance being greater than DVFSPT2[P2THR]. Otherwise the pattern delay will be counted, but without interrupt generation.

## 25.5 DVFS output event/interrupt configuration

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div\_3\_clk.

### 25.5.1 Interrupts

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

### 25.5.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

**Figure 25-13. DVFS - frequency increase**

**Figure 25-14. DVFS - frequency decrease**

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

## 25.6 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

### PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

### PGC power up sequence:

- One of the power up irq is asserted.

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

**Figure 25-15. GPC-SRC handshake for reset after power gating**

### 25.6.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 25-16](#) shows PGC as part of the SoC's overall power management scheme.

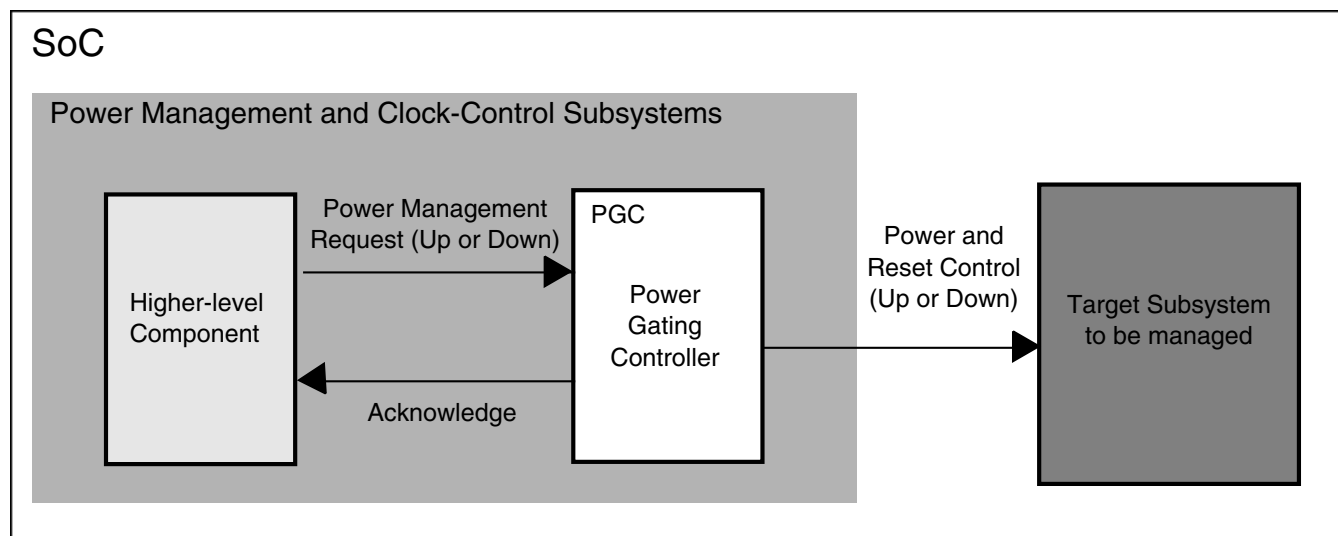

Figure 25-16. PGC Block Diagram

### 25.6.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

## 25.7 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

### 25.7.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

## 25.8 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

**GPC memory map**

Field	Description
31–0 ISR4	IRQ[159:128] status, read only

## 25.9 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

### NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by [GPC base address] + [PGC CPU/GPU/DISPLAY Offset].

## PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	<p>After asserting power toggle on/off signal (switch_b), the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation.</p> <p><b>NOTE:</b> SW2ISO must not be programmed to zero.</p>
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 SW	<p>After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting power toggle on/off signal (switch_b).</p> <p><b>NOTE:</b> SW must not be programmed to zero.</p> <p><b>NOTE:</b> The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See <a href="#">Clock Controller Module (CCM)</a>.</p>

### 25.9.3 Pull Down Sequence Control Register (PGC\_DISPLAY\_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 248h offset = 20D\_C248h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																ISO2SW				0		ISO									
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1

#### PGC\_DISPLAY\_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). <b>NOTE:</b> ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 ISO	After a power-down request (pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO before asserting isolation. <b>NOTE:</b> ISO must not be programmed to zero.

### 25.9.4 Power Gating Controller Status Register (PGC\_DISPLAY\_SR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 24Ch offset = 20D\_C24Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0															PSR
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## PGC\_DISPLAY\_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.  0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

## 25.9.5 PGC Control Register (PGC\_GPU\_CTRL)

The PGCR enables the response to a power-down request.

Address: 20D\_C000h base + 260h offset = 20D\_C260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															PCR
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## PGC\_GPU\_CTRL field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PCR	Power Control  <b>NOTE:</b> PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up.  0 Do not switch off power even if pdn_req is asserted. 1 Switch off power when pdn_req is asserted.

## 25.9.6 Power Up Sequence Control Register (PGC\_GPU\_PUPSCR)

The PUPSCR contains the power-up timing parameters.

Address: 20D\_C000h base + 264h offset = 20D\_C264h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PGC\_GPU\_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting power toggle on/off signal (switch_b), the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation. <b>NOTE:</b> SW2ISO must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 SW	After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting power toggle on/off signal (switch_b). <b>NOTE:</b> SW must not be programmed to zero. <b>NOTE:</b> The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See <a href="#">Clock Controller Module (CCM)</a> .

## 25.9.7 Pull Down Sequence Control Register (PGC\_GPU\_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 268h offset = 20D\_C268h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## PGC\_GPU\_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b).  <b>NOTE:</b> ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 ISO	After a power-down request (pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO before asserting isolation.  <b>NOTE:</b> ISO must not be programmed to zero.

## 25.9.8 Power Gating Controller Status Register (PGC\_GPU\_SR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 26Ch offset = 20D\_C26Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## PGC\_CPU\_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting , the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation.  <b>NOTE:</b> SW2ISO must not be programmed to zero. The SW2ISO value should be chosen such that the delay before negating isolation is greater than the LDO ramp-up time.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 SW	After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting .  <b>NOTE:</b> SW must not be programmed to zero.  <b>NOTE:</b> The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See <a href="#">Clock Controller Module (CCM)</a> .

## 25.9.11 Pull Down Sequence Control Register (PGC\_CPU\_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 2A8h offset = 20D\_C2A8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0																ISO2SW								0	ISO							
W																	ISO2SW									ISO							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	

## PGC\_CPU\_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of clocks equal to the value of ISO2SW before negating .  <b>NOTE:</b> ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 ISO	After a power-down request (pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO before asserting isolation.  <b>NOTE:</b> ISO must not be programmed to zero.

## 25.9.12 Power Gating Controller Status Register (PGC\_CPU\_SR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 2ACh offset = 20D\_C2ACh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### DVFSC\_DVFSSIG0 field descriptions

Field	Description
31–29 WSW5	General purpose load tracking signal weight dvfs_w_sig[5]
28–26 WSW4	General purpose load tracking signal weight dvfs_w_sig[4]
25–23 WSW3	General purpose load tracking signal weight dvfs_w_sig[3]
22–20 WSW2	General purpose load tracking signal weight dvfs_w_sig[2]
19–12 -	This field is reserved. Reserved
11–6 WSW1	General purpose load tracking signal weight dvfs_w_sig[1]. This value is relevant during GPC1 counting period or when GPB1 is set.
5–0 WSW0	General purpose load tracking signal weight dvfs_w_sig[0]. This value is relevant during GPC0 counting period or when GPB0 is set.

## 25.10.5 DVFS general purpose bit 0 weight counter (DVFSC\_DVFSGPC0)

DVFS general purpose bits weight counter.

Address: 20D\_C180h base + 10h offset = 20D\_C190h

**DVFSC\_DVFSGPC0 field descriptions**

Field	Description
31 C0STRT	<p>C0STRT - Counter 0 start</p> <p>Setting of this bit will initialize down counting of the GPC0 value.</p> <p>Bit is self-cleared next cycle after setting.</p> <p>Any setting of this bit will re-start GPC0 counter to the GPC0 value.</p> <p>GPB0 bit disables (overrides) GPC0 counter - WSW0 weight is applicable continuously</p>
30 C0ACT	C0ACT - Counter 0 active indicator

*Table continues on the next page...*

**DVFSC\_DVFSGPC0 field descriptions (continued)**

Field	Description
	1 General Purpose bit0 counter didn't reach value of "0" - the WSW0 is provided to DVFS calculation 0 General Purpose bit0 counter reached value of "0" - the instead of WSW0, "0" (zero) is provided to DVFS calculation
29–17 -	This field is reserved. reserved
16–0 GPBC0	GPBC0 - General Purpose bits Counter 0 During period of this counter the GeP bit 0 will be set and WSW0 will be added to the calculations.

**25.10.6 DVFS general purpose bit 1 weight counter (DVFSC\_DVFSGPC1)**

DVFS general purpose bits weight counter1.

Address: 20D\_C180h base + 14h offset = 20D\_C194h

**DVFSC\_DVFSGPC1 field descriptions**

Field	Description
31 C1STRT	C1STRT - Counter 1start Setting of this bit will initialize down counting of the GPC1 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC1 counter to the GPC1 value. GPB1 bit disables (overrides) GPC1 counter - WSW1 weight is applicable continuously
30 C1ACT	C1ACT - Counter 1 active indicator 1 General Purpose bit1 counter didn't reach value of "0" - the WSW1 is provided to DVFS calculation 0 General Purpose bit1 counter reached value of "0" - the instead of WSW1, "0" (zero) is provided to DVFS calculation
29–17 -	This field is reserved. reserved
16–0 GPBC1	GPBC1 - General Purpose bits Counter 1 During period of this counter the GeP bit 1 will be set and WSW1 will be added to the calculations.

**25.10.7 DVFS general purpose bits enables (DVFSC\_DVFSGPBT)**

Address: 20D\_C180h base + 18h offset = 20D\_C198h

**DVFSC\_CNTR field descriptions**

Field	Description
31–29 DIV3CK	DIV3CK - div_3_clk division ratio inside the DVFS module. According to the <a href="#">Table 25-39</a>
28 DVFEV	Always give a DVFS event. 0 Do not give an event always. 1 Always give event.
27 LBMI	Load buffer full mask interrupt. This bit masks the generation of this interrupt. Load buffer full interrupt is masked (LBFL0 and LBFL1 bits still will be updated, but interrupt won't be generated) Load buffer full interrupt is enabled.
26 LBFL1	Load buffer 1 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged) 1 Load buffer0 is full. 0 Load buffer0 is not full.
25 LBFL0	Load buffer 0 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged)

*Table continues on the next page...*

**DVFS\_CNTR field descriptions (continued)**

Field	Description
	1 Load buffer1 is full. 0 Load buffer1 is not full.
24 DVFS	DVFS Interrupt select. These bits define destination of DVFS interrupts.  1 MCU interrupt will be generated for DVFS events. 0 SDMA interrupt will be generated for DVFS events.
23 PIRQS	PIRQS - Pattern IRQ Source * write '1' to clear. Writing '1' will clear interrupt if interrupt was from pattern  1 DVFS IRQ source was from pattern 0 DVFS IRQ source was not from pattern
22 FSVAIM	DVFS Frequency adjustment interrupt mask. This bit masks the DVFS frequency adjustment interrupt. FSVAI status bits will be still asserted in relevant cases.  1 interrupt is masked. 0 interrupt is enabled.
21–20 FSVAI[1:0]	FSVAI DVFS Frequency adjustment interrupt. These status bits indicate that the system frequency should be changed.  00 no interrupt 01 frequency should be increased. Low priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). 10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency). 11 frequency should be increased immediately. High priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).
19 Reserved	This read-only field is reserved and always has the value 0.
18 MAXF	Maximum frequency reached. Interrupt will not be created in maximum frequency reached and frequency increase required.  1 max frequency reached 0 max frequency not reached
17 MINF	Minimum frequency reached. Interrupt will not be created in minimum frequency reached and frequency decrease required.  1 min frequency reached 0 min frequency not reached
16–11 DIV_RATIO	DIV_RATIO - Divider value. Divider divides the input ARM clock, following the table <a href="#">Table 25-40</a>
10 Reserved	This read-only field is reserved and always has the value 0.
9 PFUE	PFUE - Period Frequency Update Enable  1 enabled 0 disabled
8–6 PFUS	PFUS - Periodic Frequency Update Status

*Table continues on the next page...*

17 PT3A	PT3A - Pattern 3 currently active (read-only)  1 active 0 non-active
16–0 FPTN3	FPTN3 - Frequency pattern 3 counter  During period of this counter the frequency will be set to the EMA-detected level.

# Chapter 26

## General Purpose Input/Output (GPIO)

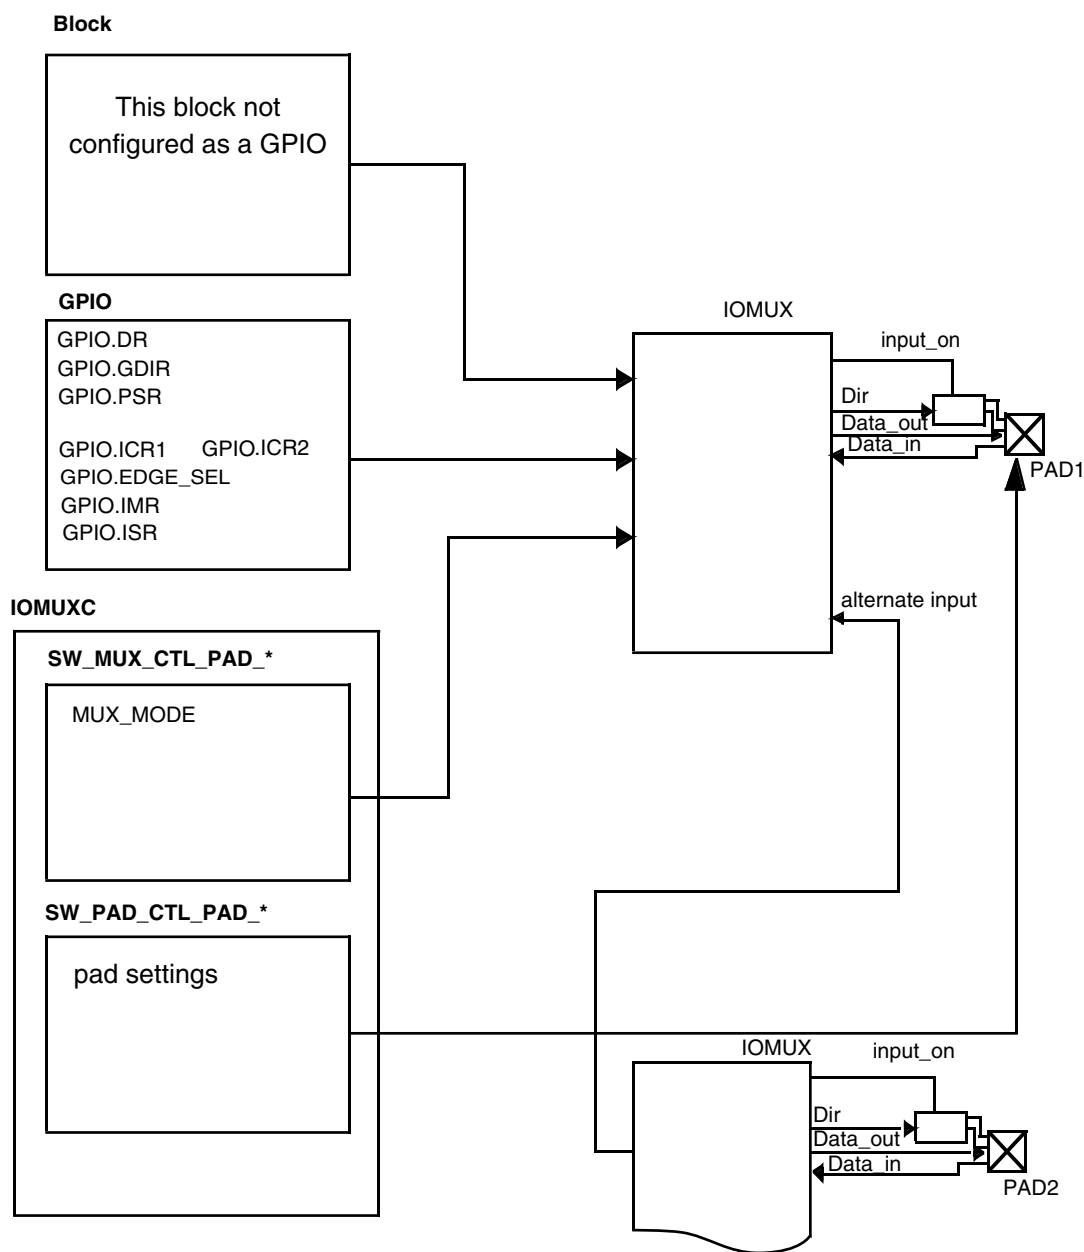

### 26.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

[Figure 26-1](#) shows the chip multiplexing scheme.

**Figure 26-1. Chip IOMUX Scheme**

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO\_DR)
- GPIO direction register (GPIO\_GDIR)
- Pad sample register (GPIO\_PSR)
- Interrupt control registers (GPIO\_ICR1, GPIO\_ICR2)

- Edge select register (GPIO\_EDGE\_SEL)
- Interrupt mask register (GPIO\_IMR)
- Interrupt status register (GPIO\_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO\_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for  $n = 0 - 7$ ). However, individual interrupt indications from other GPIOx are not available.

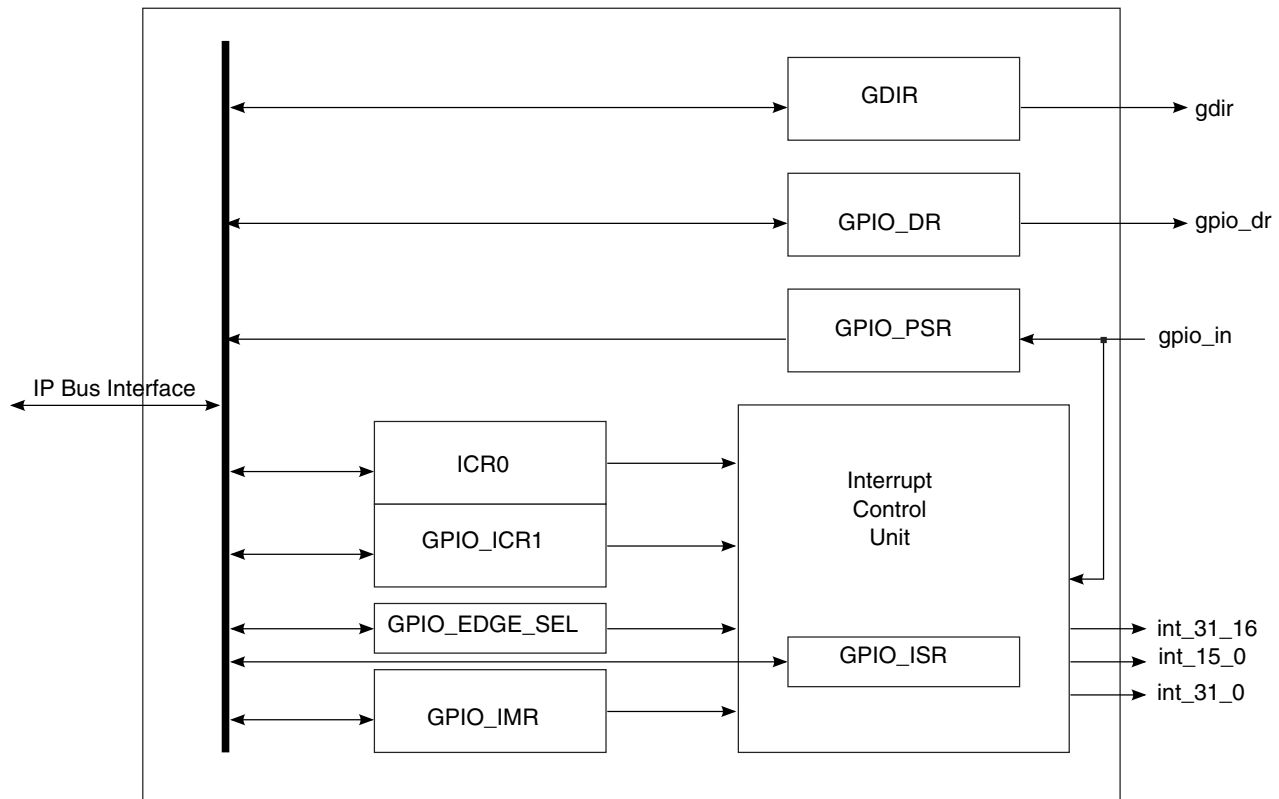

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

## 26.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 26-2](#).

**Figure 26-2. GPIO Block Diagram**

## 26.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (GPIO\_DR)
  - Controls the direction of the signal using the GPIO direction register (GPIO\_GDIR)
  - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO\_PSR).
- GPIO interrupt capabilities:
  - Supports up to 32 interrupts

- Identifies interrupt edges
- Generates three active-high interrupts to the SoC interrupt controller

## 26.2 External Signals

The tables found here describe the external signals of GPIO.

**Table 26-1. GPIO1 External Signals**

## 26.3 Clocks

The table found here describes the clock sources for GPIO.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 26-6. GPIO Clocks**

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 26.4 GPIO Functional Description

This section provides a complete functional description of the block.

### 26.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO\_GDIR).

When configured as an output (GPIO\_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO\_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO\_GDIR bit = 0), the state of the input can be read from the corresponding GPIO\_PSR bit.

## 26.4.2 GPIO Programming

### 26.4.2.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC) ).
2. Configure GPIO direction register to input (GPIO\_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

#### NOTE

While the GPIO direction is set to input (GPIO\_GDIR = 0), a read access to GPIO\_DR does not return GPIO\_DR data. Instead, it returns the GPIO\_PSR data, which is the corresponding input signal value.

### 26.4.2.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO\_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO\_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
```

```

write sw_mux_ctl_pad<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5

```

### 26.4.3 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO\_ICR1 and GPIO\_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO\_ICR1 and GPIO\_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

## 26.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

**GPIO memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	<a href="#">26.5.1/1171</a>

## 26.5.2 GPIO data register (GPIOx\_DR)

The 32-bit GPIO\_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO\_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

Address: Base address + 0h offset

### GPIOx\_DR field descriptions

Field	Description
31–0 DR	<p>Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).</p> <p><b>NOTE:</b> The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.</p>

### 26.5.3 GPIO direction register (GPIOx\_GDIR)

GPIO\_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### GPIOx\_GDIR field descriptions

Field	Description
31–0 GDIR	GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.  <b>NOTE:</b> GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.  0 <b>INPUT</b> — GPIO is configured as input. 1 <b>OUTPUT</b> — GPIO is configured as output.

### 26.5.4 GPIO pad status register (GPIOx\_PSR)

GPIO\_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the ipg\_clk\_s clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**GPIOx\_IMR field descriptions**

Field	Description
31–0 IMR	Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.

**GPIOx\_IMR field descriptions (continued)**

Field	Description
	Settings: Bit IMR[n] (n=0...31) controls interrupt n as follows:  0 <b>UNMASKED</b> — Interrupt n is disabled. 1 <b>MASKED</b> — Interrupt n is enabled.

**26.5.8 GPIO interrupt status register (GPIOx\_ISR)**

The GPIO\_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																	w1c															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**GPIOx\_ISR field descriptions**

Field	Description
31–0 ISR	Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.  When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.

### 26.5.9 GPIO edge select register (GPIOx\_EDGE\_SEL)

GPIO\_EDGE\_SEL may be used to override the ICR registers' configuration. If the GPIO\_EDGE\_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

GPIOx\_EDGE\_SEL field descriptions

Field	Description
31–0 GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

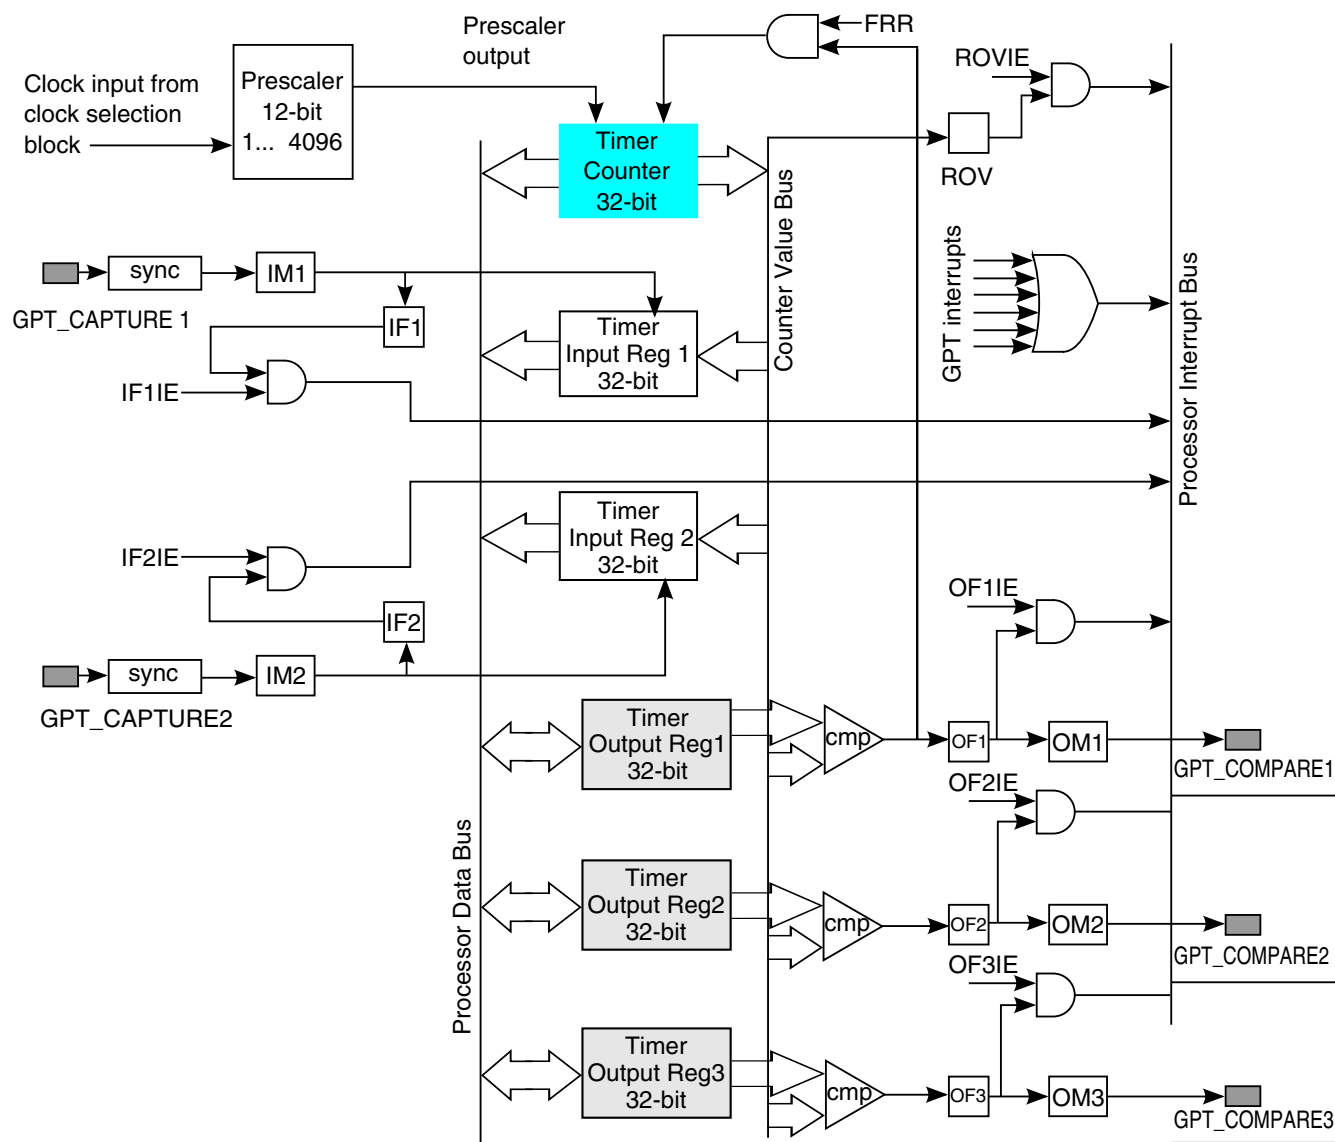

# Chapter 27

## General Purpose Timer (GPT)

### 27.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO\_CMPOUT $n$  pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

**Figure 27-1. GPT Block Diagram**

The following figure shows the GPT functional clocking scheme.

**Figure 27-2. GPT Counter Clocks Diagram**

### 27.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

### 27.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
  - [Restart Mode](#)
  - [Free-Run Mode](#)

## 27.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

**Table 27-1. GPT External Signals**

Signal	Description	Pad	Mode	Direction
GPT_CLK	Input pin for an external clock that the counter can be operated at.	FEC_TXD0	ALT4	I
		LCD_DAT23	ALT4	
GPT_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	FEC_MDIO	ALT4	I
		LCD_DAT18	ALT4	
GPT_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	FEC_TX_CLK	ALT4	I
		LCD_DAT19	ALT4	
GPT_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	FEC_RX_ER	ALT4	O
		LCD_DAT20	ALT4	
GPT_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	FEC CRS_DV	ALT4	O
		LCD_DAT21	ALT4	
GPT_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	FEC_RXD1	ALT4	O
		LCD_DAT22	ALT4	

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

### 27.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT\_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

## 27.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT\_CAPTURE1 , GPT\_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

## 27.2.3 Output Compare Signals

The output compare signals: GPT\_COMPARE1, GPT\_COMPARE2, GPT\_COMPARE3, indicate that output compare events have gone through a specified transition.

## 27.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 27-2. GPT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg\_clk\_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg\_clk\_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg\_clk)

If the Peripheral Clock or the External Clock is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to  $< 1/4$  frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

This 24MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24MHz Crystal Oscillator Clock is divided by a 24MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT\_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT\_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT\_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

**Figure 27-3. Prescaler Value Change Timing Diagram**

## 27.4 Functional Description

This section provides a complete functional description of the GPT.

### 27.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

#### 27.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT\_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

### 27.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

### 27.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT\_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 27-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT\_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT\_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT\_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

#### 27.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT\_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

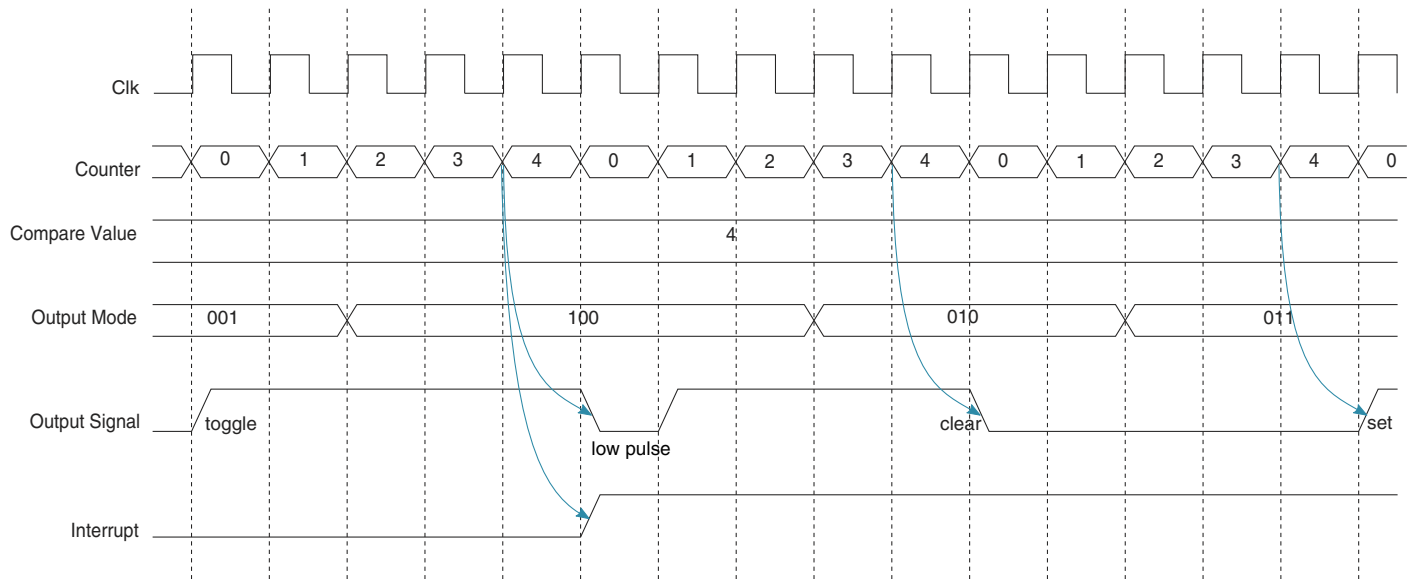

**Figure 27-4. Input Capture Event Timing**

### 27.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT\_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT\_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

**Figure 27-5. Output Compare and Interrupt Timing**

### 27.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT\_IR register; the associated status bit is the ROV bit in the GPT\_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT\_IR register); the associated status bits are IF2 and IF1 (in the GPT\_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT\_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT\_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

#### 27.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT\_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

#### 27.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT\_CR control register), then the GPT timer is halted.

### 27.5 Initialization/ Application Information

#### 27.5.1 Selecting the Clock Source

The CLKSRC field in the GPT\_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT\_CR register.
2. Disable GPT interrupt register (GPT\_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT\_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT\_CR
5. Change clock source CLKSRC to the desired value in GPT\_CR register.
6. Assert the SWR bit in GPT\_CR register.
7. Clear GPT status register (GPT\_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT\_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT\_CR register.
10. Enable GPT interrupt register (GPT\_IR).

## 27.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT\_CR) and the GPT Output Compare Register1 (GPT\_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT\_ICR1, GPT\_ICR2, GPT\_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips\_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

**GPT memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

**GPT\_IR field descriptions**

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 ROVIE	Rollover Interrupt Enable. The ROVIE bit controls the Rollover interrupt. 0 Rollover interrupt is disabled. 1 Rollover interrupt enabled.
4 IF2IE	IF2IE Input capture 2 Interrupt Enable IF1IE Input capture 1 Interrupt Enable The IFnIE bit controls the IFnIE Input Capture <i>n</i> Interrupt Enable.

*Table continues on the next page...*

**GPT\_IR field descriptions (continued)**

Field	Description
	0 IF2IE Input Capture <i>n</i> Interrupt Enable is disabled. 1 IF2IE Input Capture <i>n</i> Interrupt Enable is enabled.
3 IF1IE	See IF2IE
2 OF3IE	OF3IE Output Compare 3 Interrupt Enable OF2IE Output Compare 2 Interrupt Enable OF1IE Output Compare 1 Interrupt Enable The OF <i>n</i> IE bit controls the Output Compare Channel <i>n</i> interrupt.  0 Output Compare Channel <i>n</i> interrupt is disabled. 1 Output Compare Channel <i>n</i> interrupt is enabled.
1 OF2IE	See OF3IE
0 OF1IE	See OF3IE

**27.6.5 GPT Output Compare Register 1 (GPT\_OCR1)**

The GPT Compare Register 1 (GPT\_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT\_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209\_8000h base + 10h offset = 209\_8010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**GPT\_OCR3 field descriptions**

Field	Description
31–0 COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

### 27.6.8 GPT Input Capture Register 1 (GPT\_ICR1)

The GPT Input Capture Register 1 (GPT\_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209\_8000h base + 1Ch offset = 209\_801Ch

GPT\_ICR1 field descriptions

Field	Description
31–0 CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

### 27.6.9 GPT Input Capture Register 2 (GPT\_ICR2)

The GPT Input capture Register 2 (GPT\_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209\_8000h base + 20h offset = 209\_8020h

GPT\_ICR2 field descriptions

Field	Description
31–0 CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

### 27.6.10 GPT Counter Register (GPT\_CNT)

The GPT Counter Register (GPT\_CNT) is the main counter's register. GPT\_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209\_8000h base + 24h offset = 209\_8024h

GPT\_CNT field descriptions

Field	Description
31–0 COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

# Chapter 28

## 2D Graphics Processing Unit (GPU2D)

### 28.1 Overview

The R2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The V2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The GPU2D cores provide powerful graphics at low power consumption, utilizing the smallest silicon footprints. Dynamic power consumption is minimized by extensive use of localized clock gating.

R2D GPU Hardware acceleration is brought to numerous 2D including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU R2D block diagrams is presented in the [Figure 28-1](#).

V2D GPU Hardware acceleration is brought to numerous VG applications including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU V2D block diagrams is presented in the [Figure 28-2](#).

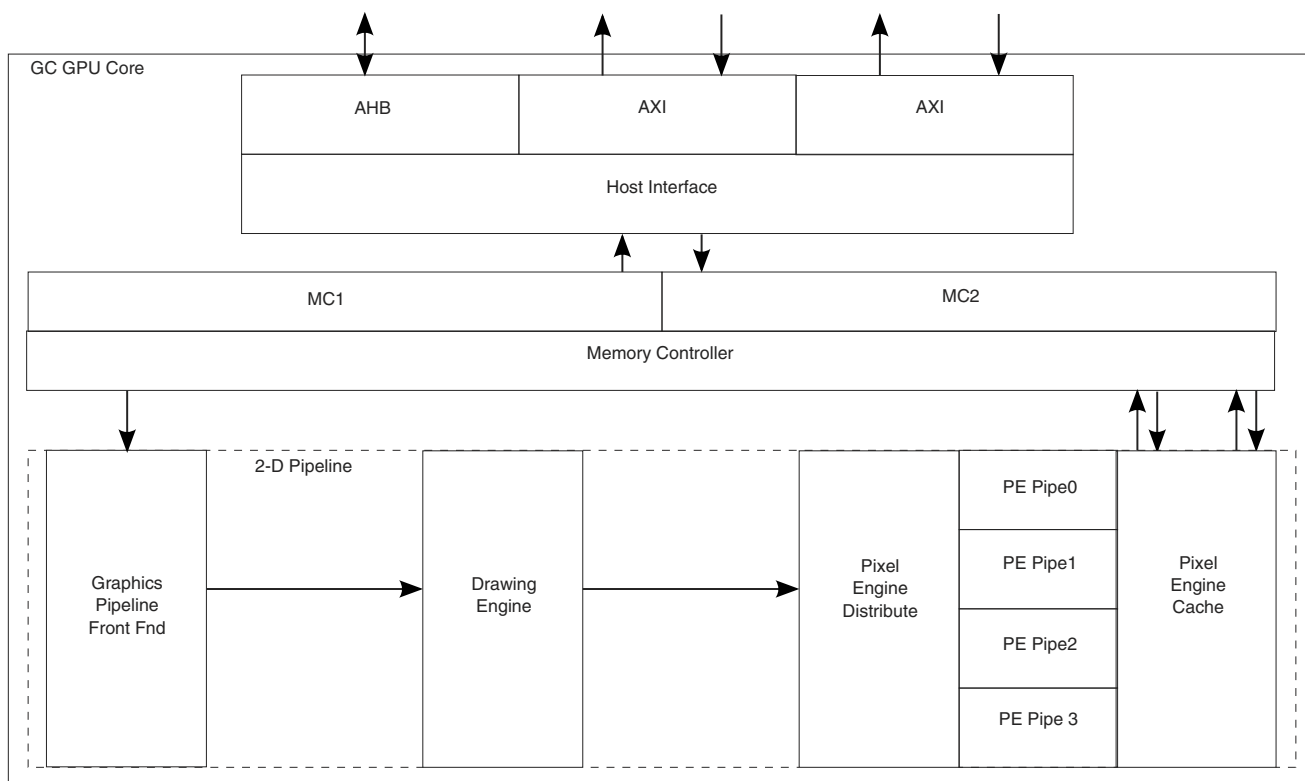

### 28.2 GPU2D Block Diagram

#### 28.2.1 R2D GPU

The R2D graphics processing unit (GPU) defines a high-performance 2D raster graphics core that accelerates the 2D graphics display.

R2D GPU supports acceleration of the following graphics APIs:

- DirectFB (on Linux)
- GDI/DirectDraw (on Windows CE)

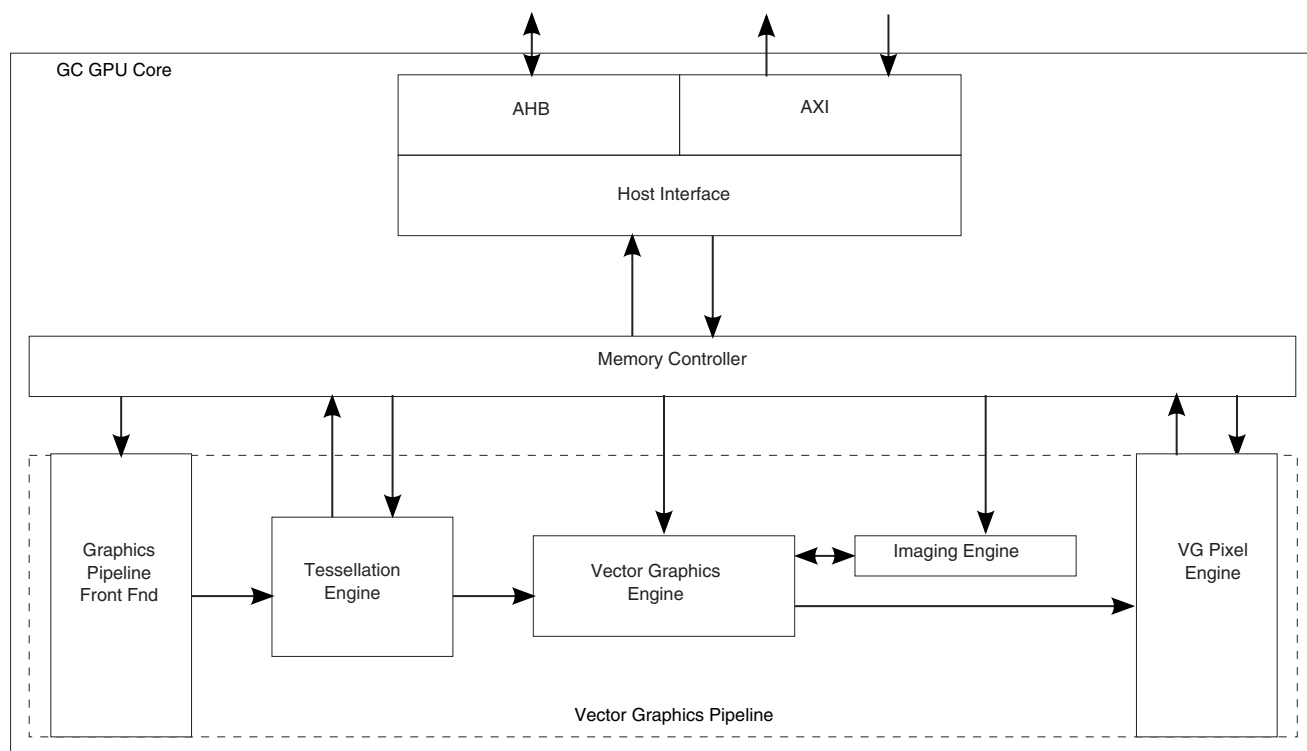

**Figure 28-1. R2D GPU Block Diagram**

### 28.2.2 V2D GPU

V2D GPU defines a high-performance graphics core designed for hardware acceleration of OpenVG vector graphics display. V2D GPU is designed for easy integration onto the SoC.

V2D GPU supports the following graphics APIs:

- OpenVG 1.1

**Figure 28-2. V2D GPU Block Diagram**

## 28.3 GPU2D Features

The following sections describe the functional features of the R2D and V2D GPU.

### 28.3.1 Full Featured R2D GPU Pipeline

- Bit BLT
- Stretch BLT
- Rectangle fill and clear
- Line drawing
- Filter BLT
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending, including Java 2 Porter-Duff compositing blending rules
- 32K x 32K coordinate system
- 90 / 180 / 270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask

### 28.3.2 Full Featured V2D GPU Pipeline

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint(gradient and pattern)
- Blending
- Higher-level Geometric Primitives
- Image Warping

## 28.4 GPU2D OPERATIONS

### 28.4.1 R2D GPU Operations

Information detailing the R2D GPU operations can be found [here](#).

#### 28.4.1.1 Line

The LINE operation draws a line. Coordinates for two points are given: start point and end point. The end point is not drawn.

Lines are rendered using the Bresenham algorithm. The Bresenham algorithm has the advantage of using integer arithmetic and has no accumulation of rounding errors. In the case of line, only ROP2 and ROP4 are supported. It operates on pattern and destination. The pattern should have a transparency mask in order to use ROP4.

Clipping is supported for lines on a per pixel basis.

Figure 28-3. Line

### 28.4.1.2 Rectangle Fill and Clear

Rectangle fill creates a rectangle area with a given color. Essentially rectangle fill is a pattern fill, where an 8x8 pattern is initialized with the specified color. It supports ROP2 and ROP4 with the pattern and destination as its inputs. If ROP4 is used, the pattern should have a transparency mask.

Clear is similar to rectangle fill except that it does not use a pattern. A 32-bit clear value with 4-bit byte mask is used to fill the entire rectangle area.

Both rectangle fill and clear support clipping, which is performed on a per primitive basis.

### 28.4.1.3 BitBLT

Bit blit transfers data from one area of a memory (source) to another area of the memory (destination).

The source and destination can be from the same or different memory locations. Both source and destination must be described by a rectangular area. The source and destination rectangles can be the same size (most bit blits are of this nature) or they can be different sizes, in which case the operation becomes a stretch or shrink blit.

Bit blit supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color.

Clipping can be performed on a primitive basis.

Figure 28-4. BitBLT

The BIT BLT primitive supports the following 10 source and 8 destination image formats:

Table 28-1. Bit BLT Formats

Formats	Source Image	Destination Image
A1R5G5B5	Yes	Yes
A4R4G4B4	Yes	Yes
X1R5G5B5	Yes	Yes
X4R4G4B4	Yes	Yes
R5G6B5	Yes	Yes
A8R8G8B8	Yes	Yes
X8R8G8B8	Yes	Yes
A8	Yes	Yes
1-bit monochrome	Yes	No
8-bit color index	Yes	No

28.4.1.4 Stretch BLT

The STRETCH BLT primitive performs a BitBlt operation with stretch or shrink. The modified Bresenham algorithm is used to generate corresponding coordinates for fast stretching.

The stretch factor is specified in a 15.0 fixed-point format. Stretch blit is not allowed to overlap therefore no part of source and destination can share any piece of memory. Non-stretch blits can overlap. For stretch blit, clipping is performed on a per pixel basis.

### 28.4.1.5 Monochrome Expansion and Mask BLT

Monochrome expansion and mask blit are different operations, although both use the bit stream from command buffer and both can be the source for ROP4 source selection. This means that each output pixel can be a combination of source, pattern, monochrome mask (for masked blits) and destination.

#### 28.4.1.5.1 Monochrome expansion

For monochrome expansion, the bit from the stream is used to switch on/off a solid color that is defined in a register. This mechanism enables the use of just one bit per pixel to represent colors. In effect, the MONO EXPANSION primitive increases color representation from one bit per pixel to multiple bits per pixel. A typical application for mono color is font drawing.

Monochrome expansion does not support overlapping of the source and destination. It is the responsibility of the driver to make sure that the command will never be executed with overlapping source and destination.

#### 28.4.1.5.2 Mask BLT

For Mask BLT, the bit from the stream is used to toggle on/off a color in the source frame buffer. Mask BLT takes its color source from memory and its monochrome mask from the command stream. Clipping is supported and is performed on a per pixel basis.

#### 28.4.1.6 Filter BLT

Filter blit performs high quality scaling, up or down, using an FIR re-sampling filter with up to 9 taps. Sub-pixel coordinates (locations between the pixel grids) are generated by the drawing engine. The filter block in the drawing engine uses the sub-pixel information to select the appropriate filter kernel. R2D GPU processes 1 pixel every cycle when performing filter blit.

A stretch- or shrink-factor of 15.16 fixed-point format is supported. To generate a single destination pixel requires 9 source pixels. An image is scaled in two passes, one for X-dimension (HOR\_FILTER\_BLT) and the other for Y-dimension (VER\_FILTER\_BLT). Software sets up the filter kernel/coefficient table and the kernel size, as well as a temporary buffer for storing intermediate results. After the first pass is completed, intermediate results are sent back to memory, and then the second pass starts to scale the first-pass image. Because of this two-step procedure, the throughput of FILTER BLT is lower than that of STRETCH BLT. Also the Filter Kernel Table may need to be reloaded, and some cycles are consumed in calculating the stepping parameters.

When the stretch or shrink factor is 1, the filterBlit works as a bitBlit copy. It can be used as format converter in that case, for instance, YUV to RGB converter. To use as a format converter, only one pass (HOR\_FILTER\_BLT or VER\_FILTER\_BLT) is needed. To optimize the memory bandwidth, when using filterBlit to do YUV to RGB filtering, the temporary target buffer format can be specified as YUY2 to process Y-dimension filtering (VER\_FILTER\_BLT). This is to avoid converting YUV to A8R8G8B8 in the 1st vertical pass to reduce the memory bandwidth and increase the pixel processing rate. This is the only special case that GPU may use YUY2 as target format.

The FILTER BLT primitive supports the following 13 source and 7 destination image formats:

Filter BLT Formats

Formats		Source Image	Destination Image
A1R5G5B5		Yes	Yes
A4R4G4B4		Yes	Yes
A8R8G8B8		Yes	Yes
R5G6B5		Yes	Yes
X1R5G5B5		Yes	Yes
X4R4G4B4		Yes	Yes
X8R8G8B8		Yes	Yes
YUV	NV12 (4:2:0, 2 planes)	Yes	No
	NV16 (4:2:2, 2 planes)	Yes	No
	UYVY (4:2:2, interleave)	Yes	No
	YUY2 (4:2:2, interleave)	Yes	No
	YV12 (4:2:0, 3 planes)	Yes	No
	8-bit color index	Yes	No

### 28.4.1.7 R2D Performance of different operations

Table 28-2. Performance of different operations without rotation

Primitive	Peak Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2.4 pixel / cycle	N/A	Done on primitive basis
Clear	2.4 pixel / cycle	N/A	Done on primitive basis
Blit	2.4 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1.6 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

**Table 28-3. Performance of different operations with rotation**

Primitive	Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2 pixel / cycle	N/A	Done on primitive basis
Clear	2 pixel / cycle	N/A	Done on primitive basis
Blit	2 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

### 28.4.1.8 Rotation

90° / 180° / 270° / X-Flip / Y-Flip / Mirror rotation is supported for all primitives.

### 28.4.1.9 Transparency Mode

For monochrome expansion:

- Opaque
- Conditional transparency. Transparent if the current pixel matches the specified value.

For blits:

- Opaque
- Masked transparency. Transparent if the mask for the current pixel or pattern is zero.
- Source Conditional transparency. Transparent if the source pixel is within the specified value range.
- Destination Conditional transparency. Transparent if the destination pixel is not within the specified value range.

### 28.4.1.10 Clipping

One clipping rectangle is supported for all bitBlit primitives.

### 28.4.1.11 R2D GPU Data Formats

The graphics engine supports 14 source data formats. In addition to these 14 source formats, for RGB source formats, GPU also supports their swizzle formats (ARGB, RGBA, ABGR, BGRA) for RGB formats. For YUV formats, GPU supports their U/V swap formats.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8
- NV12
- NV16
- UYVY (4:2:2)
- YUY2 (4:2:2)
- YV12 (4:2:0)
- 8-bit color index

There are 8 destination data formats supported by the graphics engine. In addition to these destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8

### 28.4.1.12 ARGB Data Conversion of R2D GPU

The pixels read from source or destination will be expanded into A8R8G8B8 format internally to maintain lossless pixel operations. The resulting pixels will be converted into the destination format.

### 28.4.1.13 YUV to RGB Conversion of R2D GPU

YUV data can be converted into 8-bit per component RGB format at the output of the cache only. Once converted, there is no way back to YUV format. GPU supports BT.601 and BT.709 YUV to RGB color conversion standards.

In BT.601, the YUV to RGB conversion is done using the following approximation:

$$16 \leq Y \leq 235$$

$$16 \leq U \leq 240$$

$$16 \leq V \leq 240$$

$$A = Y - 16$$

$$B = U - 128$$

$$C = V - 128$$

$$R = \text{clip}((298 * A + 410 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 101 * B - 209 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 519 * B + 128) \gg 8)$$

The Y, U and V components are clamped prior to the conversion.

Y is clamped between 16 and 235, inclusively.

U and V are clamped between 16 and 240, inclusively.

In BT.709, the R, G, B equations are slightly changed to

$$R = \text{clip}((298 * A + 461 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 55 * B - 137 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 543 * B + 128) \gg 8)$$

### 28.4.1.14 Color Index Input Conversion Support of R2D GPU

Color index is supported for source data only. A look-up table with 256 entries is provided for indexing the data. The table is fully programmable. The conversion is done when pixels are read out of the cache.

### 28.4.1.15 Source/Destination Pre-multiply and De-Multiply Support

GPU supports source pre-multiply source alpha or global alpha, or source global color for global colorizing. On destination, the GPU supports destination pre-multiply destination alpha, destination de-multiply alpha.

### 28.4.1.16 Alpha Blending

The GPU supports alpha blending together with ROP. The alpha blending function is performed on ROP function result source.

The general alpha blending equations are:

$$Cd = Fs * Cs' + Fd * Cd'$$

$$Ad = Fs * As'' + Fd * Ad''$$

Where

- Cs' is the source color component (adjusted for NPM if necessary)
- Cd' is the destination color component (adjusted for NPM if necessary)
- As'' is the modified source alpha component
- Ad'' is the modified destination alpha component
- Fs is fraction of the source that contributes to the final value
- Fd is fraction of the destination that contributes to the final value

The blending is done in 5 logical stages (not real implementation stages):

1. Transparent/opaque conversion
  - In this stage, the incoming alpha (source or destination independently) can be inverted if needed to match the internal alpha rule. Internally, an alpha of 0 means transparent, while an alpha of "0xFF" means opaque. External content might follow the opposite rule. The output of the block is either As (Ad for destination) or 1-As (1-Ad for destination).
2. Global value substitution
  - A global alpha value from a register can be used to substitute or scale the incoming alpha. An incoming alpha As can pass-through, be directly substituted by Ags (global alpha) or scaled by the global alpha value (As \* Ags). The source and destination have distinct global alpha values.
3. Blending factor generation
  - At this stages, the blending factors are generated (refer to table below). Each alpha can take the values 0, 1, A or 1-A depending on the blending mode.
4. Final blending
  - This is the final stage which implements blending equations.

The fractions take the values described in the following table, depending on the blending mode.

**Table 28-4. Blending Modes Fractions Description**

Blending Mode	Fs	Fd
Clear	0	0
SRC	1	0
DST	0	1
SRC_OVER	1	$1 - A_s''$
DST_OVER	$1 - A_d''$	1
SRC_IN	$A_d''$	0
DST_IN	0	$A_s''$
SRC_OUT	$1 - A_d''$	0
DST_OUT	0	$1 - A_s''$
SRC_ATOP	$A_d''$	$1 - A_s''$
DST_ATOP	$1 - A_d''$	$A_s''$
XOR	$1 - A_d''$	$1 - A_s''$

To control the blending modes, the following register fields are used:

- 1 bit for transparent/opaque conversion for source alpha
- 1 bit for transparent/opaque conversion for destination alpha
- 2 bits for source alpha modifications, to specify the 3 cases ( $A_s$ ,  $A_g$ ,  $A_s * A_g$ )
- 2 bits for destination alpha modifications, to specify the 3 cases ( $A_d$ ,  $A_g$ ,  $A_d * A_g$ )
- 4 bits to select between the 12 blending modes
- 8-bits for global source alpha
- 8-bits for global destination alpha

Alpha blending is supported on bit blit and filter blit primitives.

### **28.4.1.17 GPU Cache Management**

SW cache flush is supported to flush the GPU cache to memory. Auto-flush of GPU cache is also supported. SW sets up the auto-flush interval, and HW will do the cache flush automatically at programmable intervals.

## **28.4.2 V2D GPU Operations**

Information detailing the V2D GPU operations can be found [here](#).

### **28.4.2.1 OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION**

OpenVG is a royalty-free, cross-platform API managed by the member-funded consortium known as Khronos Group. It provides a low-level hardware acceleration interface for vector graphics libraries such as Flash and SVG. OpenVG is used for acceleration of high-quality vector graphics for user interfaces and text on small screen devices.

#### **28.4.2.2 Advantages of Using OpenVG**

- Hardware accelerators can reduce power consumption by up to 90% compared to a software engine.
- Scalability with high-quality rendering, including anti-aliasing, to different screen sizes without multiple bitmaps.

#### **28.4.2.3 OpenVG Target Applications**

- SVG Viewers
- Portable Mapping Applications
- E-book Readers
- Games
- Scalable User Interface

#### **28.4.2.4 OpenVG Features**

#### **28.4.2.4.1 Core API**

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint (gradient and pattern)
- Blending
- Dithering

#### **28.4.2.4.2 The VGU Utility Library**

- Higher-level Geometric Primitives
- Image Warping

#### **28.4.2.4.3 OpenVG Rendering Pipeline**

- Stage 1: Path, Transformation, Stroke, and Paint
- Stage 2: Stroked Path Generation
- Stage 3: Transformation
- Stage 4: Rasterization
- Stage 5: Clipping and Masking
- Stage 6: Paint Generation
- Stage 7: Image Interpolation
- Stage 8: Blending and Anti-aliasing

# Chapter 29

## I2C Controller (I2C)

### 29.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

**References:** This document assumes an understanding of the following document:

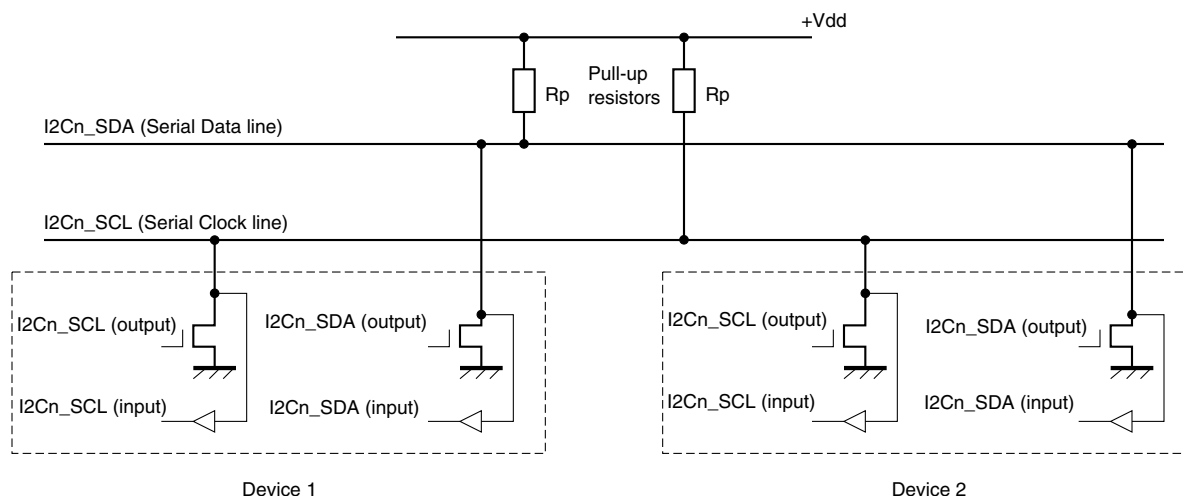

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

#### NOTE

Three independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

**Figure 29-1. Connection of devices to I2C bus**

The I2C interface operates at up to 400 kbps, but the speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

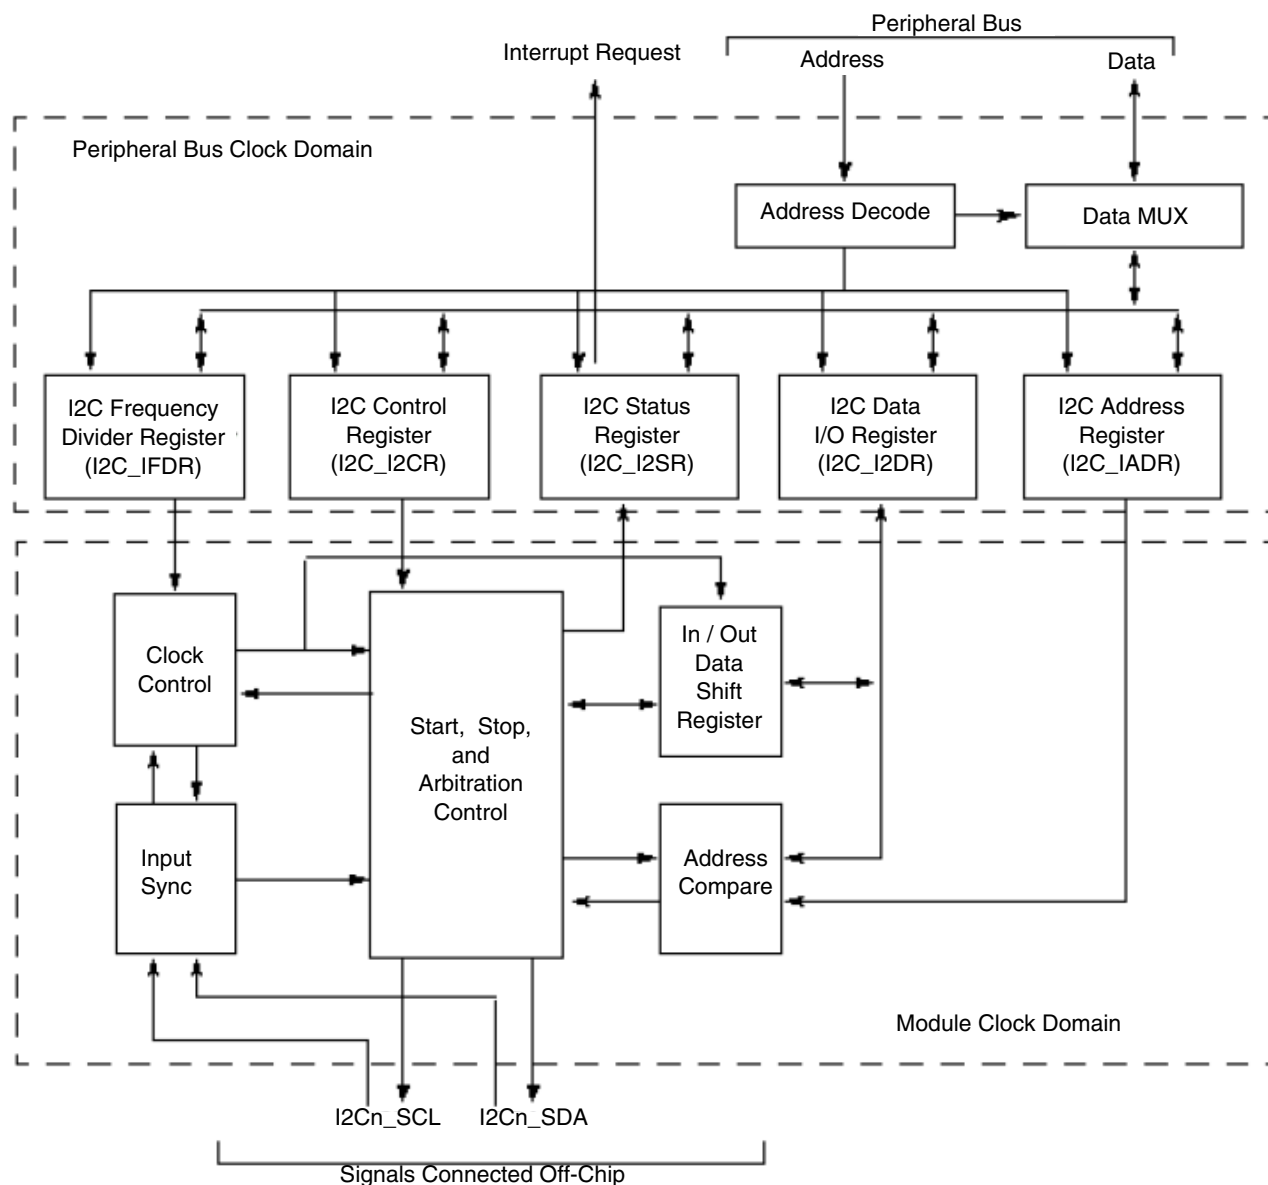

Figure 29-2. I2C block diagram

### 29.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

### 29.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

## 29.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn\_SCL and I2Cn\_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn\_SCL and I2Cn\_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

**Table 29-1. I2C External Signals**

I2C1_SCL (SCL)	Serial Clock	AUD_RXFS	ALT1	IO
		I2C1_SCL	ALT0	
		HSIC_DAT	ALT1	
I2C1_SDA (SDA)	Serial Data	AUD_RXC	ALT1	IO
		I2C1_SDA	ALT0	
		HSIC_STROBE	ALT1	
I2C2_SCL (SCL)	Serial Clock	EPDC_SDCLK	ALT2	IO
		I2C2_SCL	ALT0	
		KEY_COL0	ALT1	
		LCD_DAT16	ALT4	

*Table continues on the next page...*

**Table 29-1. I2C External Signals (continued)**

I2C2_SDA (SDA)	Serial Data	EPDC_SDLE	ALT2	IO
		I2C2_SDA (SDA)	ALT0	
		KEY_ROW0	ALT1	
		LCD_DAT17	ALT4	
I2C3_SCL (SCL)	Serial Clock	AUD_RXFS	ALT4	IO
		EPDC_SDCE2	ALT1	
		REF_CLK_24M	ALT1	
I2C3_SDA (SDA)	Serial Data	AUD_RXC	ALT4	IO
		EPDC_SDCE3	ALT1	
		REF_CLK_32K	ALT1	

## 29.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 29-2. I2C Clocks**

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	perclk_clk_root	Peripheral access clock

- Peripheral clock (ipg\_clk\_s): This clock is used for peripheral bus register read/writes.
- Module clock (ipg\_clk\_patref): This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

## 29.4 Functional description

This section provides a complete functional description of the block.

## 29.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

### NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

## 29.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

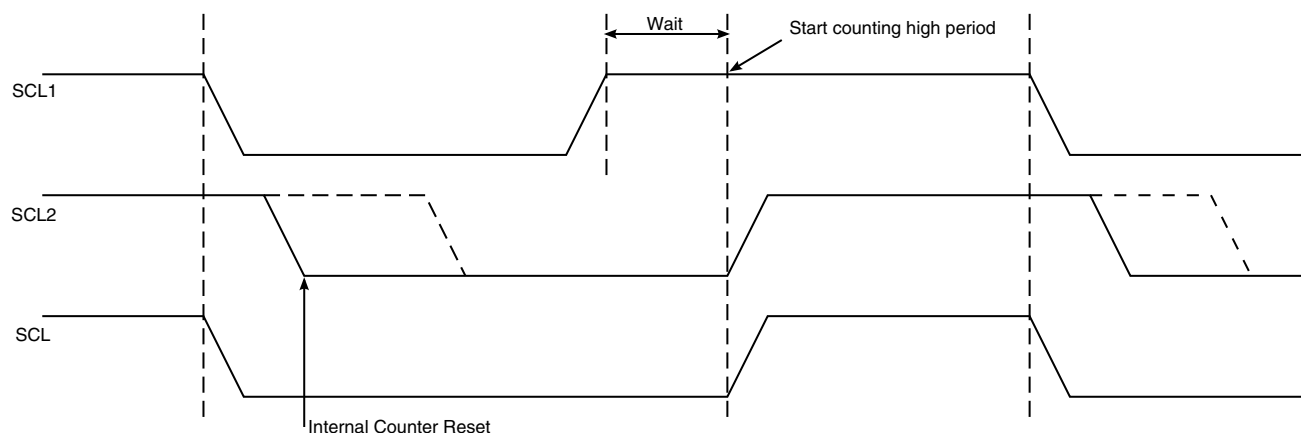

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn\_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C\_I2SR[IAL] to indicate loss of arbitration).

### 29.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 29-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

**Figure 29-3. Synchronized clock SCL**

### 29.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

## 29.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

## 29.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

## 29.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

## 29.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C\_IADR and I2C\_IFDR registers) initiated by deasserting the I2C\_I2CR[IEN] bit

## 29.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C\_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

## 29.4.10 Byte order

The block only supports the Little-Endian mode.

## 29.5 Initialization

### NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

### 29.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C\_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C\_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C\_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C\_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

### 29.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C\_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is busy after writing the calling address to the data register (I2C\_I2DR), before proceeding to load data into the data register (I2C\_I2DR).

### 29.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C\_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C\_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C\_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C\_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 29-5](#).

The data transferring bit (I2C\_I2SR[ICF]) is cleared either by reading from I2C\_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C\_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C\_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C\_I2CR[MTX] should be toggled and a dummy read of the I2C\_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C\_I2SR[IAAS] = 1), the slave read/write bit I2C\_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C\_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

### 29.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C\_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

### 29.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

### 29.5.6 Slave mode

In the slave interrupt service routine (see [Figure 29-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C\_I2CR[MTX]) according to the I2C\_I2SR[SRW]. Writing to the I2C\_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C\_I2DR for slave transmits, or read from I2C\_I2DR in Slave Receive mode. A dummy read of I2C\_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C\_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C\_I2DR) then releases SCL so the master can generate a Stop signal.

### 29.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn\_SDA stops, but 12Cn\_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C\_I2SR[IAL] = 1), and the Slave mode is selected (I2C\_I2CR[MSTA] = 0).

See the flow chart in [Figure 29-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C\_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C\_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C\_I2SR[IAL] bit gets set only for 12Cn\_SDA=0, 12Cn\_SCL=0/1, 12Cn\_SDA=1, and 12Cn\_SCL=0; but not for 12Cn\_SDA=1 and I2Cn\_SCL=1, which is the equivalent of Bus Idle state.

Figure 29-4. I2C Programming state diagram

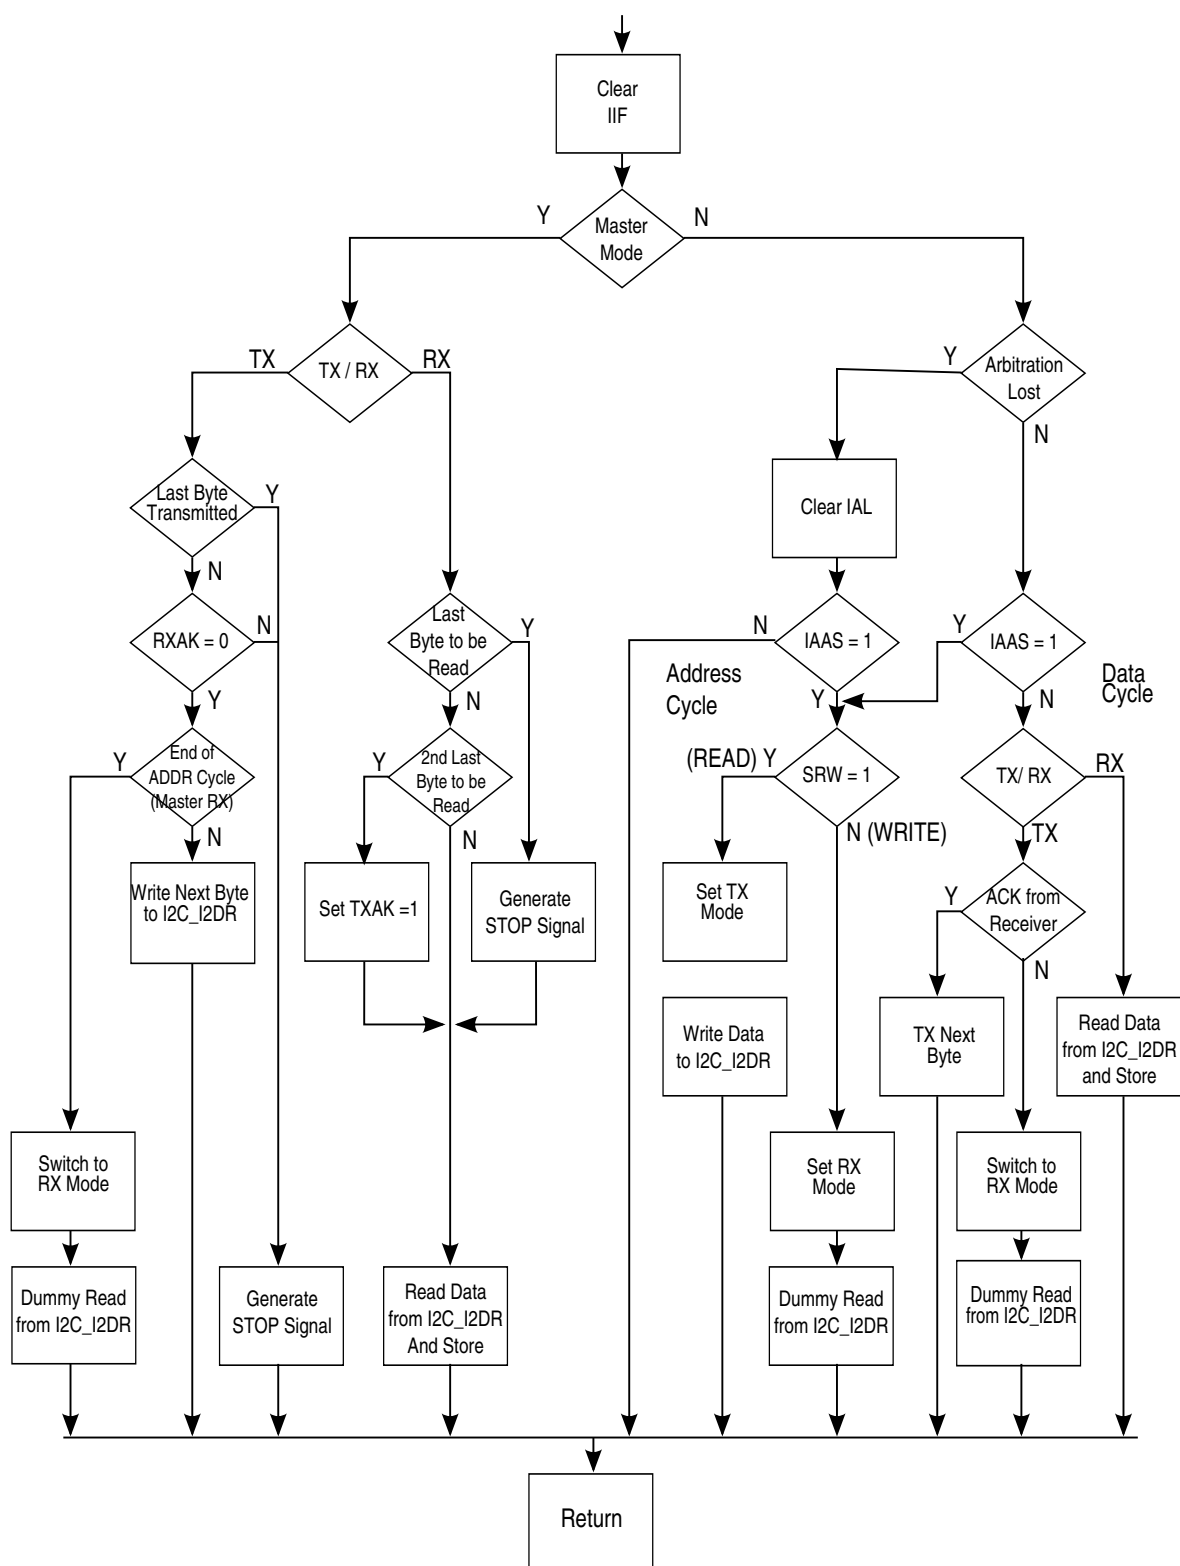

Figure 29-5. Flowchart of typical I2C interrupt routine

**NOTE**

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C\_I2DR register should be performed so I2C can read the next receive data.

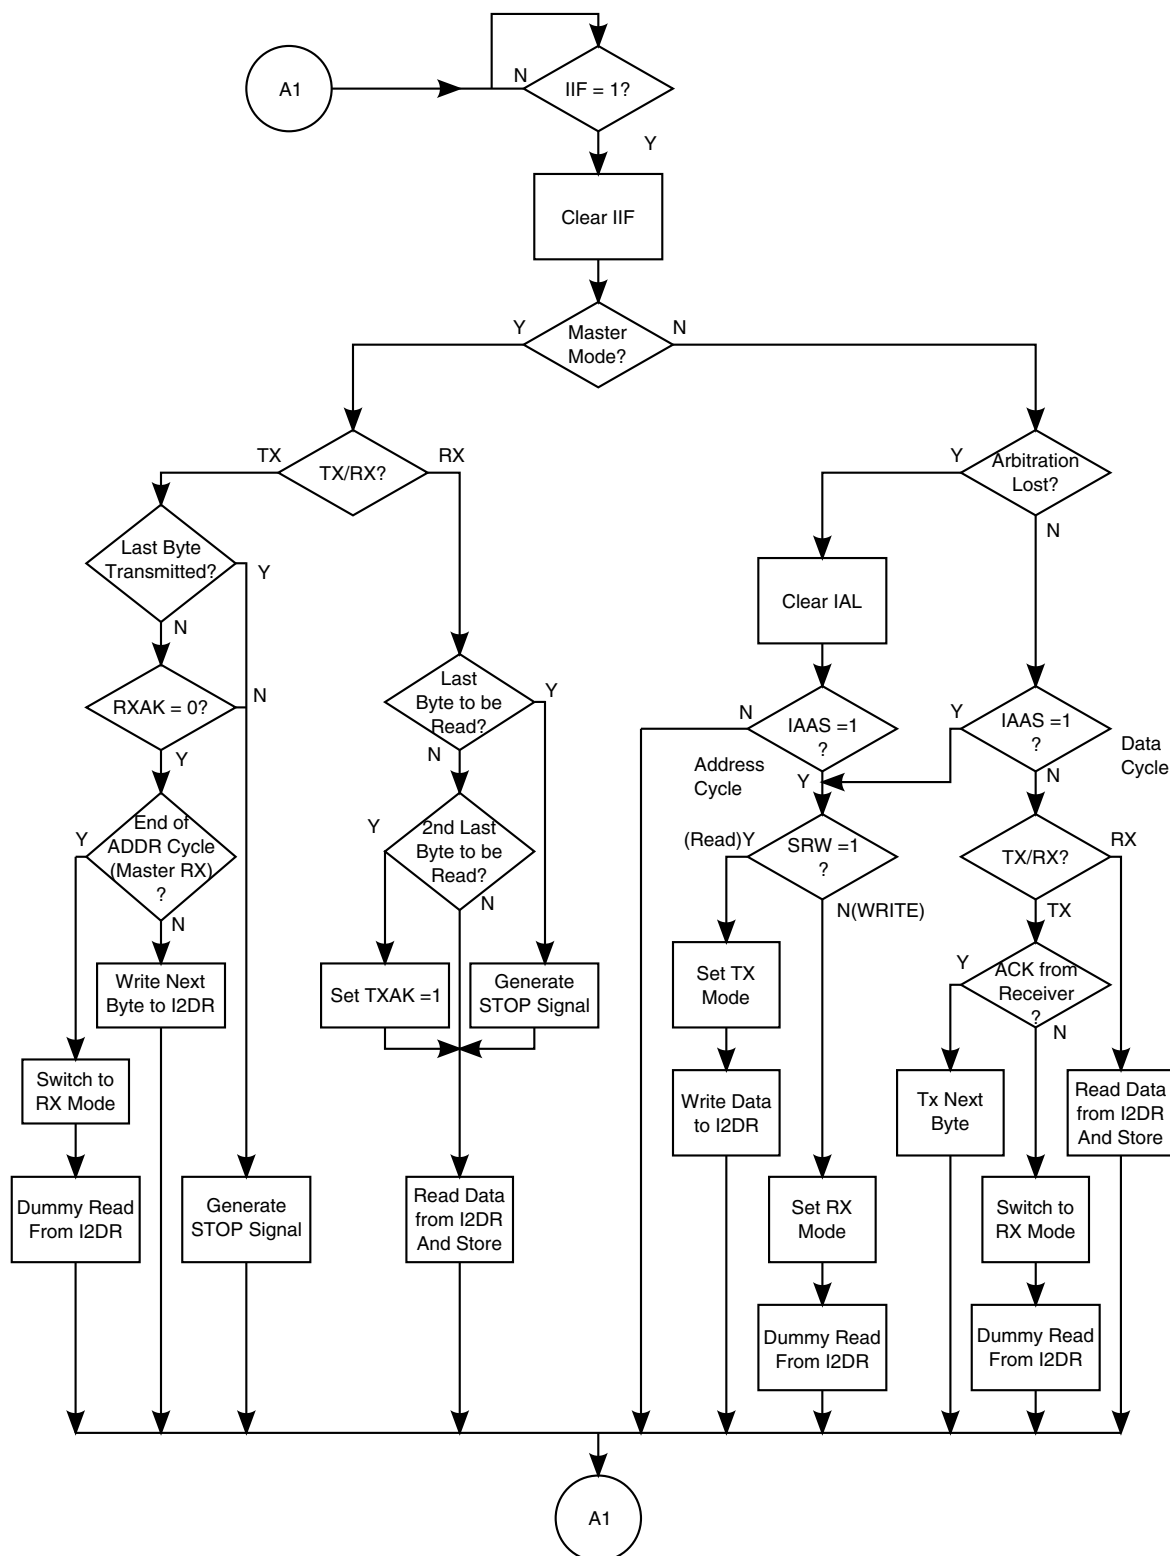

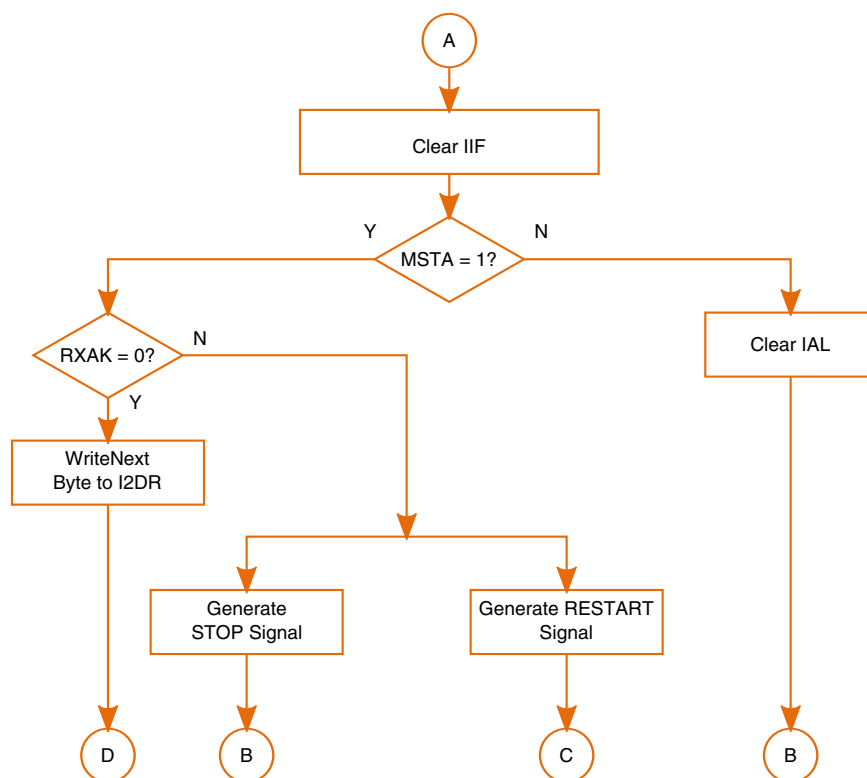

Figure 29-6. Flowchart for typical I2C polling routine

**NOTE**

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is  $T_{\min} = 25 \mu\text{s}$  ( $=2.5 \times 10 \mu\text{s}$ ). This value can be calculated for any bus frequency. The formula is  $T_{\min} = 10/F_{\text{SCL}}$ , where  $F_{\text{SCL}}$  is the frequency of the I2C clock (SCL).

**Figure 29-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1**

**Figure 29-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2**

Figure 29-7 and Figure 29-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C\_I2CR register
- Perform the next data transfer by writing to the I2C\_I2DR register

### NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

## 29.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C\_I2CR[RSTA] bit and before writing to the I2C\_I2DR register. The maximum possible clock period of the module clock is 78 ns.

## 29.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

### NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

**I2C memory map**

## 29.7.2 I2C Address Register (I2Cx\_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**I2Cx\_IADR field descriptions**

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus.  <b>NOTE:</b> The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

## 29.7.3 I2C Frequency Divider Register (I2Cx\_IFDR)

The I2C\_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK\_ROOT which is routed from IPG\_CLK\_ROOT. I2C clock frequency can easily be obtained by using the following formula:

**I2C clock Frequency = (PERCLK\_ROOT frequency)/(division factor corresponding to IFDR)**

By default, IPG\_CLK\_ROOT and PERCLK\_ROOT frequencies are set to 49.5MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

**PLL2 = 528MHz**

**PLL2\_PFD2 = 528MHz \* 18 / 24 = 396MHz**

**IPG\_CLK\_ROOT = (PLL2\_PFD2 / ahb\_podf) / ipg\_podf = (396MHz/4)/2 = 49.5MHz**

**PER\_CLK\_ROOT = IPG\_CLK\_ROOT/perclk\_podf = 49.5MHz/1 = 49.5MHz**

**NOTE**

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

**Table 29-13. I2C\_IFDR Register Field Values**

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160
0x01	32		0x11	320		0x21	24		0x31	192
0x02	36		0x12	384		0x22	26		0x32	224
0x03	42		0x13	480		0x23	28		0x33	256
0x04	48		0x14	576		0x24	32		0x34	320
0x05	52		0x15	640		0x25	36		0x35	384
0x06	60		0x16	768		0x26	40		0x36	448
0x07	72		0x17	960		0x27	44		0x37	512

0x0E	192		0x1E	3072		0x2E	112		0x3E	1792
0x0F	240		0x1F	3840		0x2F	128		0x3F	2048

Address: Base address + 4h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0										IC					
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**I2Cx\_IFDR field descriptions**

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
5–0 IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register.  <b>NOTE:</b> The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

## 29.7.4 I2C Control Register (I2Cx\_I2CR)

The I2C\_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	IEN	IEN	MSTA	MTX	TXAK	0	0	
Write	IEN	IEN	MSTA	MTX	TXAK	RSTA		
Reset	0	0	0	0	0	0	0	0

**I2Cx\_I2CR field descriptions**

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	<p>I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal.</p> <p>0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.</p>
6 I2EN	<p>I2C interrupt enable.</p> <p><b>NOTE:</b> If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written.</p> <p>0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.</p>
5 MSTA	<p>Master/Slave mode select bit. If the master loses arbitration, MSTa is cleared without generating a Stop signal.</p> <p><b>NOTE:</b> The module clock should be on for writing to the MSTa bit.</p> <p><b>NOTE:</b> The MSTa bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.</p>

*Table continues on the next page...*

**I2Cx\_I2CR field descriptions (continued)**

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers.  0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers.  <b>NOTE:</b> Writing TXAK applies only when the I2C bus is a receiver.  0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration.  0 No repeat start 1 Generates a Repeated Start condition
1–0 Reserved	This read-only field is reserved and always has the value 0.

**29.7.5 I2C Status Register (I2Cx\_I2SR)**

The I2C\_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write								
Reset	1	0	0	0	0	0	0	1

## I2Cx\_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared.  0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit.  0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus.  <b>NOTE:</b> When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition.  0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> <li>I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle.</li> <li>I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle.</li> </ul> <p>For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle.</p> <ul style="list-style-type: none"> <li>A Start cycle is attempted when the bus is busy.</li> <li>A Repeated Start cycle is requested in Slave mode.</li> <li>A Stop condition is detected when the master did not request it.</li> </ul> <p><b>NOTE:</b> Software cannot set the bit.</p> 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match.  0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine.  <b>NOTE:</b> The software cannot set the bit.  0 No I2C interrupt pending. 1 An interrupt is pending.

*Table continues on the next page...*

**I2Cx\_I2SR field descriptions (continued)**

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> <li>• One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).</li> <li>• An address is received that matches its own specific address in Slave Receive mode.</li> <li>• Arbitration is lost.</li> </ul>
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus.  1 A "No acknowledge" signal was detected at the ninth clock.</p>

**29.7.6 I2C Data I/O Register (I2Cx\_I2DR)**

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**I2Cx\_I2DR field descriptions**

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–0 DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p><b>NOTE:</b> The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

## Chapter 30

# IOMUX Controller (IOMUXC)

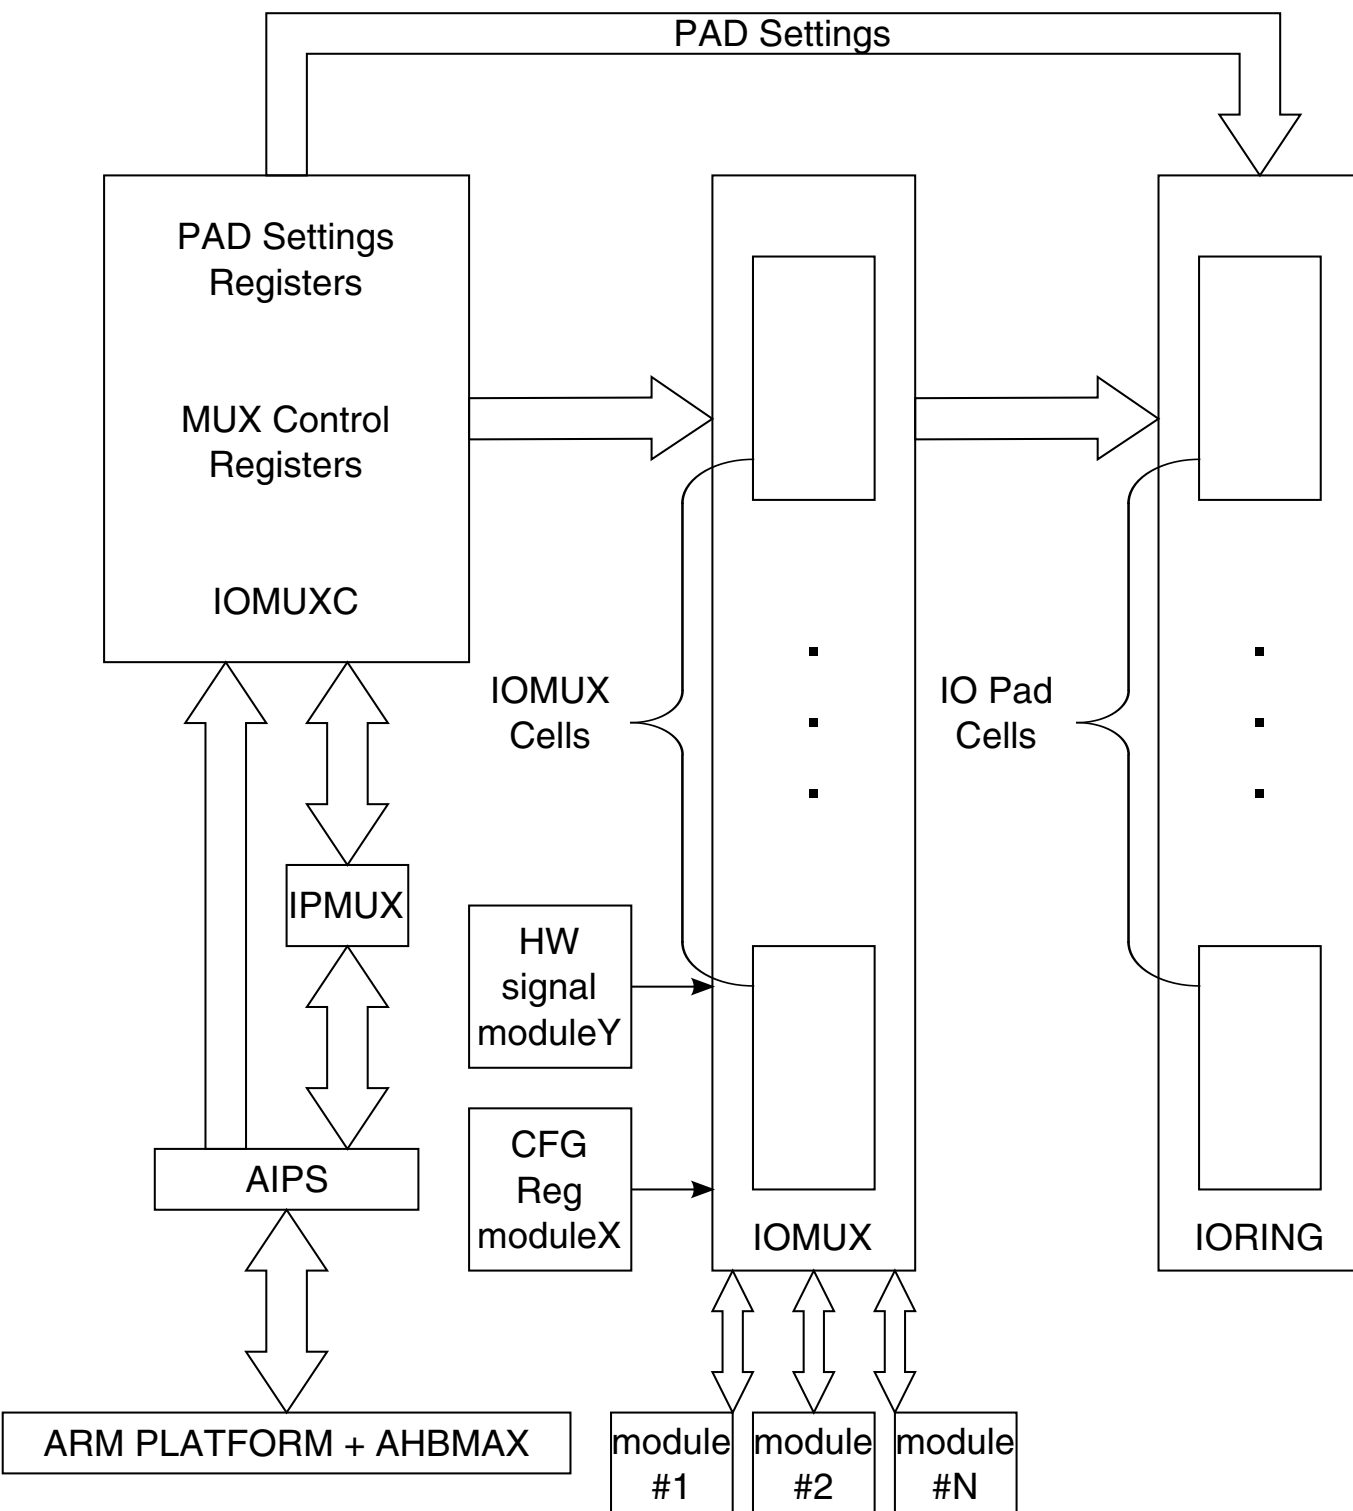

### 30.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 30-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

### Figure 30-1. IOMUX SoC Level Block Diagram

### 30.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC\_SW\_MUX\_CTL\_PAD\_<PAD NAME> or IOMUXC\_SW\_MUX\_CTL\_GRP\_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX\_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC\_SW\_PAD\_CTL\_PAD\_<PAD NAME> or IOMUXC\_SW\_PAD\_CTL\_GRP\_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX\_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

## 30.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 30-1. IOMUXC Clocks**

Clock name	Clock Root	Description
ipt_clk_io	lcdif_pix_clk_root	IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 30.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC\_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC\_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux\_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux\_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 30-2](#).

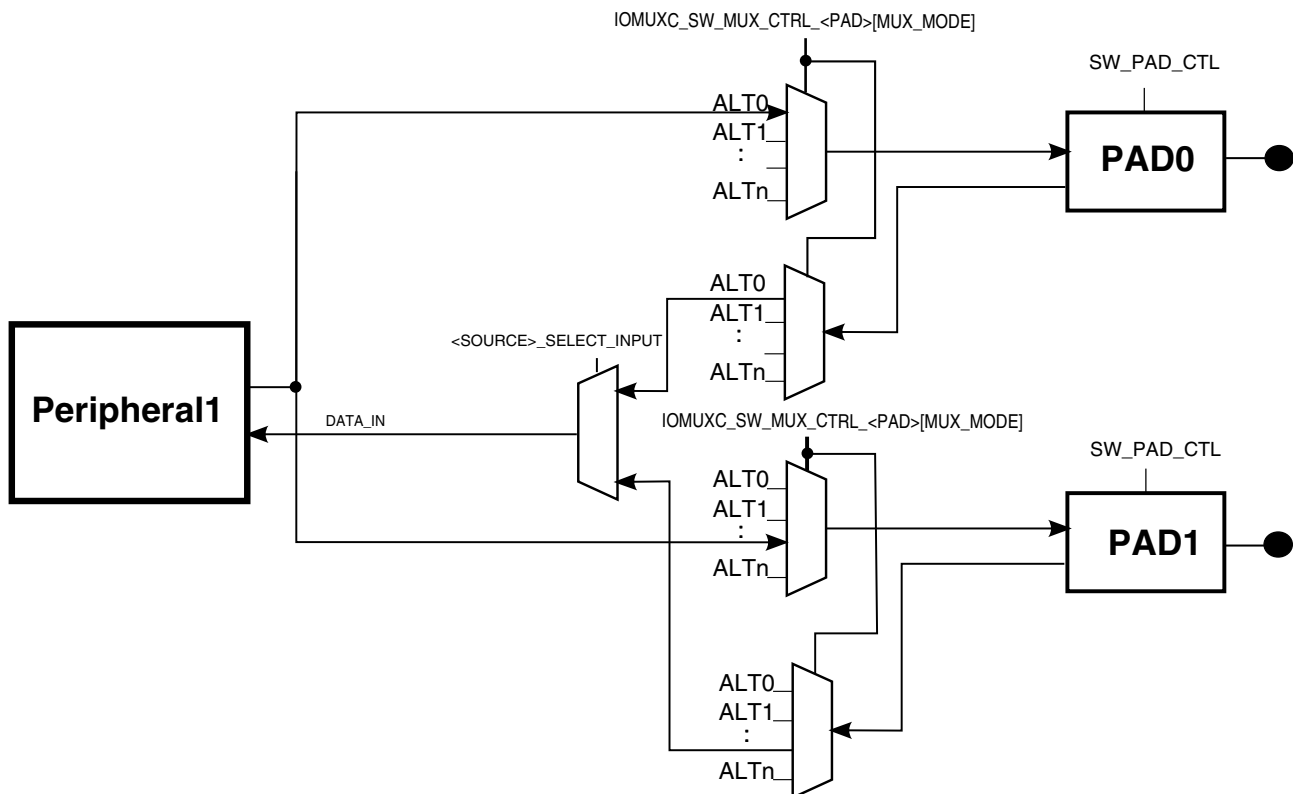

Figure 30-2. IOMUX Cell Block Diagram

### 30.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

### 30.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC\_SW\_MUX\_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

### 30.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

Figure 30-3. Daisy chain illustration

## 30.4 IOMUXC Memory Map/Register Definition
