1 Why a Mahjongg port for iLiad?

That's simple. Maybe someone wants to play Mahjongg.

2 Installation

- You need an installed [Shell Access Package](#). Please visit the [iLiad Software Wiki](#), if you don't know what this is all about.
 - You can install Jukebox on main memory/CF/MMC/SD/USB-Stick. Or you can use a memory card in USB-card-reader [e.g. 2 GB SD].
1. Copy the directories "xmahjongg.install" from zip-file to a directory of your choice on chosen memory card.
 2. Insert memory card in iLiad. If you use iLiad's "Export via USB" feature this step will be obsolete.
 3. Search for "Install xmahjongg 0.1" in Contentlister. Click on this entry.
 4. Installation is finished when "xmahjongg 0.1 Has Been Installed" is visible.

3 Usage

- Go to the root of memory card in Contentlister. You will find a folder "Programs" there. Use the Mahjongg entry to start a Mahjongg session.
- You can choose between 24 layouts.
- If you don't like the tileset and background, you can edit the files `_tileset` & `_background` in `Programs/xmahjongg`. The gif images which can load live in `_local/share/xmahjongg` on memory card.

4 Changelog

4.1 v0.1 [2007/10/26]

- This is the first release.

- It is working. But it has got some bugs. Please have a look at known bugs.

5 Known Bugs

- Refreshing of screen isn't perfect. Program relies completely on patched libX11. Please use the "page switcher" to start a full refresh of screen.
- Some of the horizontal layouts are cropped because they don't fit on screen.

Feedback, comments are welcome.

Have fun with your little iLiad, yokos
